class: · _class: · the resolved list

A deck-wide token reaches every slide

Including the slides that name a class of their own.

This deck declares `class: no-note` once, in front matter.

- Written once
  - The token is in the front matter and nowhere else. No slide in this deck repeats it.
- Read everywhere
  - This slide names `_class: content`, and the deck's token still arrives — which is the part that did not work.

Every slide you are about to see inherits it the same way.

A section carries the class information twice.

```
<section id="1" data-class="content" class="content no-note form">
```

- `data-class`
  - The raw `_class:` payload, mirrored from marp-core. It holds what the author typed on this one slide.
- `class`
  - The resolved list: the deck-wide `class:` register merged in, plus `form`, the default component, any finish or mode.

Only the second is the truth, and it is the one a transform must read.

`data-class` comes first, so the careless read wins.

PATTERN	READS	CORRECT
`/class="([^"]*)"/`	`content`	no — leftmost match is `data-class`
`/\bclass="([^"]*)"/`	`content`	no — `-` to `c` is a word boundary
`/\sclass="([^"]*)"/`	`content no-note form`	yes

A transform reading the first two saw the author's payload and none of the deck's tokens.

Two transforms shipped reading it that way.

- Below-note
  - `class: no-note` did nothing on any slide naming its own `_class:`. The opt-out looked applied and was not.
- Image structure
  - `class: image` plus `_class: dark` built no `.image-text` panel — and the DOM path, which reads `className`, built it. The two render paths disagreed.

Both read one attribute earlier in the tag than they meant to.

This slide names its own `_class:`, and stays body copy.

- A note is a footnote
  - A short paragraph after a list or a table gets a hairline rule and muted ink.
- A conclusion is not
  - "A list, then a concluding sentence" is ordinary prose, and promotion changes what it meant.

Before the fix this paragraph carried a hairline rule, because the slide named `content` and the deck's `no-note` never reached the transform.

This one names no class at all, and matches it.

- A note is a footnote
  - A short paragraph after a list or a table gets a hairline rule and muted ink.
- A conclusion is not
  - "A list, then a concluding sentence" is ordinary prose, and promotion changes what it meant.

This slide always worked. The point of the fix is that the slide above it now looks the same.

readClassAttr, and a build:check that fails the unguarded regex.

Where The Fix Lives

One reader, and a gate that keeps it the only one.
