Charts · ep-curve

The loss to plan for, once every N years

Write each point as `{return period, loss}`. The return period runs across on a log scale, so 1-in-10, 1-in-100 and 1-in-1,000 sit evenly apart, and each curve is named at its end.

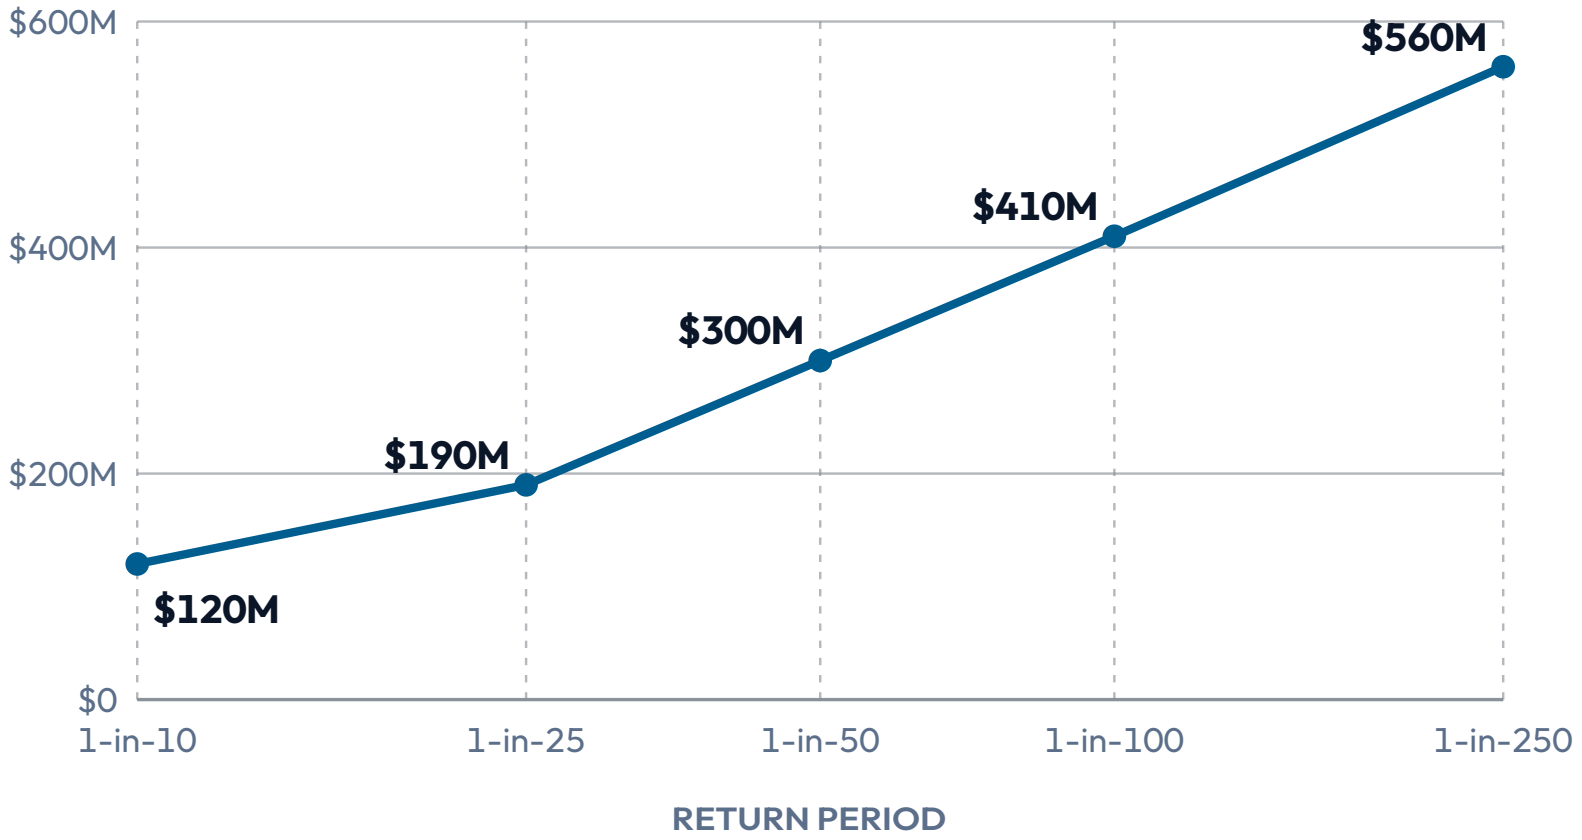

A 1-in-100 year costs $410M a single event, $480M a year.

EP CURVE

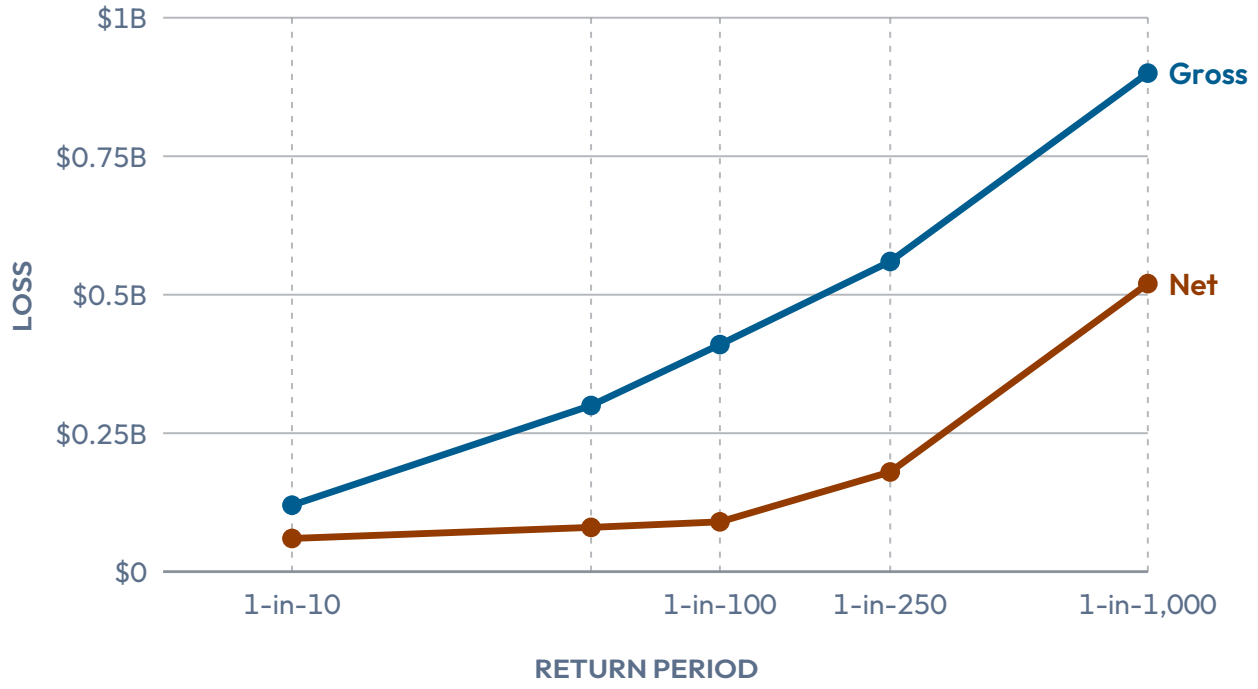

One curve prints its losses.

EP CURVE

The program takes $320M off the 1-in-100.

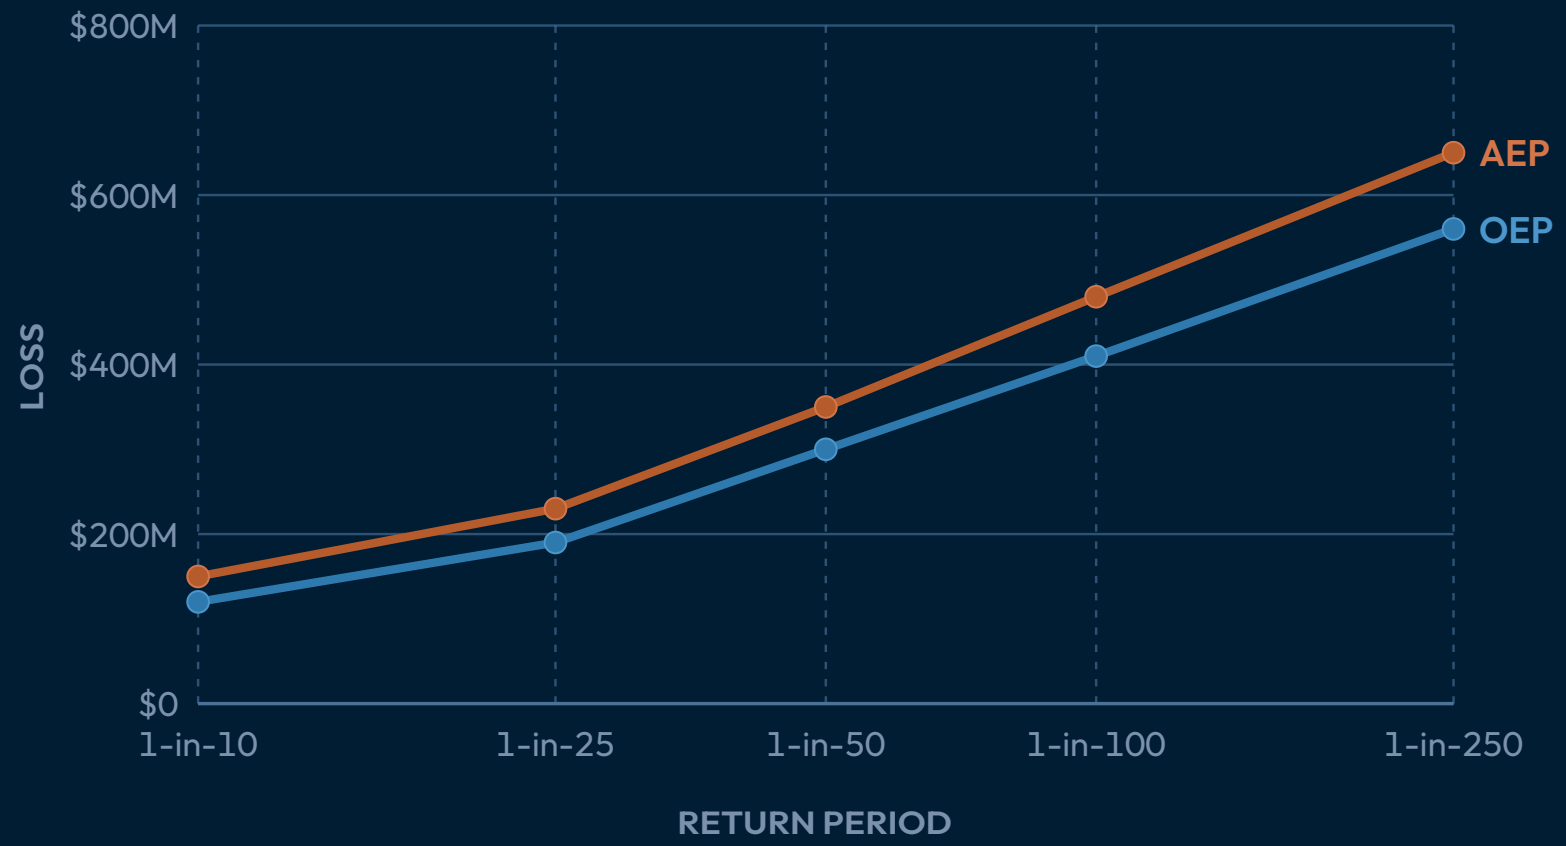

EP CURVE

Above 1-in-250 the tower is exhausted, and net climbs with gross again.

The same curves, dark.

EP CURVE

Four curves, eight return periods.
