Feature demo · finishes

A finish is a stack of layers.

A *finish* is the surface of a deck — the wax-and-polish layer over its structure and palette. Each preset composites up to four palette-blind layers behind your content: a **wash**, a **texture**, a **mark**, and an **edge**. Set `finish: atrium` once and every slide wears the same composition. This title opts out with `no-finish`.

The finish is a register, not per-slide markup.

`finish:` names the whole-deck surface in one token — orthogonal to `theme:`, which still owns the palette. The engine reads it once and paints the layered finish behind every slide, so you never repeat a class.

- Layered
  - A finish stacks `wash + texture + mark + edge` by z-index — layers combine, never replace.
- Palette-blind
  - Every layer is `color-mix()` of the theme accent — swap the theme and it recolors itself.
- Export-safe
  - Pure CSS gradients (never masks); every fade is opaque-to-opaque, so they survive the PDF and PPTX with no muddy gray.

Meridian — duotone, contours, a ghost numeral.

This slide overrides the deck with `_class: finish finish-meridian`. A diagonal duotone wash carries faint contour lines. The ghost numeral is **author-set** — this slide opts in with its own `Q3`; by default a finish paints no glyph at all.

Strata — bands, a dot-matrix, a corner tick.

Wash

Soft horizontal bands with a bold accent hairline pinned to the top edge.

Texture

A fine 26px dot-matrix, even and faint across the slide.

Mark

A corner registration tick in the top-right.

Halo — a spotlight section treatment.

A centered spotlight, concentric rings, and a whisper of a vignette frame the slide — the bookend finish for a section or closing, on a clean light canvas with dark, legible text. Set per-slide with `_class: finish finish-halo`.

Ledger — ruled lines, a margin bar, a fold.

This slide carries `_class: finish finish-ledger`: fine horizontal ruled lines, a bold accent bar down the left margin, and a top-right corner fold — a board-memo
surface. The deck-wide Atrium finish is replaced for this one slide.

Nimbus — a gradient mesh of soft blooms.

A new `mesh` wash floats three or four soft accent blooms across the slide — an organic gradient-mesh atmosphere with no pattern at all, seated by a whisper of a vignette. The wash intensity tunes how strong the blooms read. Pure premium air, set per-slide with `_class: finish finish-nimbus`.

Loom — a woven lattice, a movable glow.

Texture

A new `lattice` cross-hatch — two diagonal weaves at ±45° — on-brand for the product, with the weave pitch tunable by scale.

Wash

A corner glow, here moved to the top-left to show the placement axis at work.

Tunable

Move the glow, change the weave scale, and the whole surface re-tailors.

Savile — a tailored pinstripe, a placed monogram.

A new `pinstripe` texture rules fine vertical lines — Savile Row on a slide — with the pitch tuned by scale. The monogram is **author-set** — this slide opts in with its own `AB` initials; an unset finish shows no monogram. Editorial and tailored, set with `_class: finish finish-savile`.

Gallery — a museum keyline frame.

A new `frame` edge draws a thin inset keyline border — no soft shadow, just four crisp accent strips — around a centered spotlight. The plate numeral is **author-set** — this slide opts in with its own `04`; by default the frame carries no glyph. Museum framing, set per-slide with `_class: finish finish-gallery`.

Marks are sized, moved, and tilted — not stamped in a corner.

Every glyph-mark now carries its own **size**, **position**, and **tilt**. The `Q3` ghost here is dialed large, nudged off-center, and tilted; drop the size and it becomes a discreet corner emblem. Single-source washes (corner-glow, spotlight) gain a **movable hotspot** and a **spread** — this one's pulled to the lower-left. Exported verbatim from the Finish Studio.

brand · placed, not stamped

The brand mark moves too.

The deck logo is styled on one line, `logo-finish` — a berth, a color, a size, a scope. This deck seats it bottom-center on the title only; change one word and the mark moves, identically in the live preview and the baked PDF.

How the finish is wired.

01	Front matter declares `finish: atrium`	once
→	**The engine appends** `finish finish-atrium`	every slide
03	The compositor blends the layer props	behind content
04	A slide overrides with `_class: finish finish-<name>`	per-slide
05	A slide opts out with `no-finish`	clean

Pick it in the Studio.

The Studio's Inspector has a **Finish** field — swatch-previewed, grouped Plain and Finishes — that writes this `finish:` register for you, with the live preview updating as you choose. This slide is clean (`no-finish`), so you see the deck's default Atrium finish nowhere here.

one line to re-surface the room

Change the finish, keep the content.

Flip `finish:` to `halo`, `ledger`, or `boardroom` and the same Markdown ships with a new surface — no edits to a single slide.
