Lattice · Feature deck

Flowcharts written as a list.

Every item is a shape, a sub-list makes a group, and an arrow in a row draws a line. The chart lays itself out and routes every line around the shapes.

Incident response

Every page reaches a human within 15 minutes.

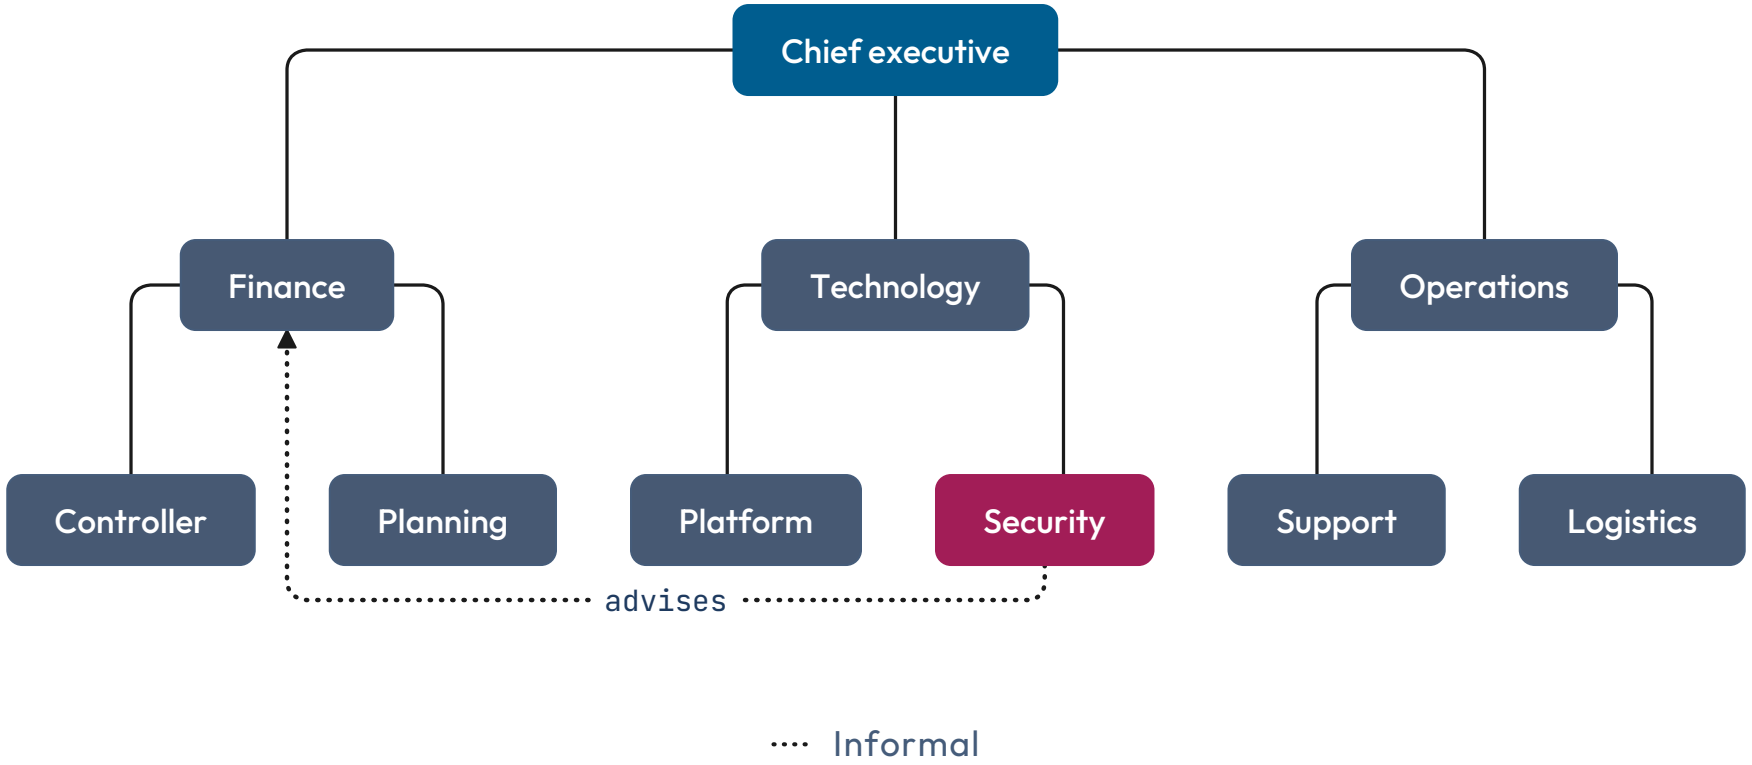

Failing — Paging path ···· Waits for business hours

SEV1 pages a human inside five minutes; everything else waits for business hours.

Operating model

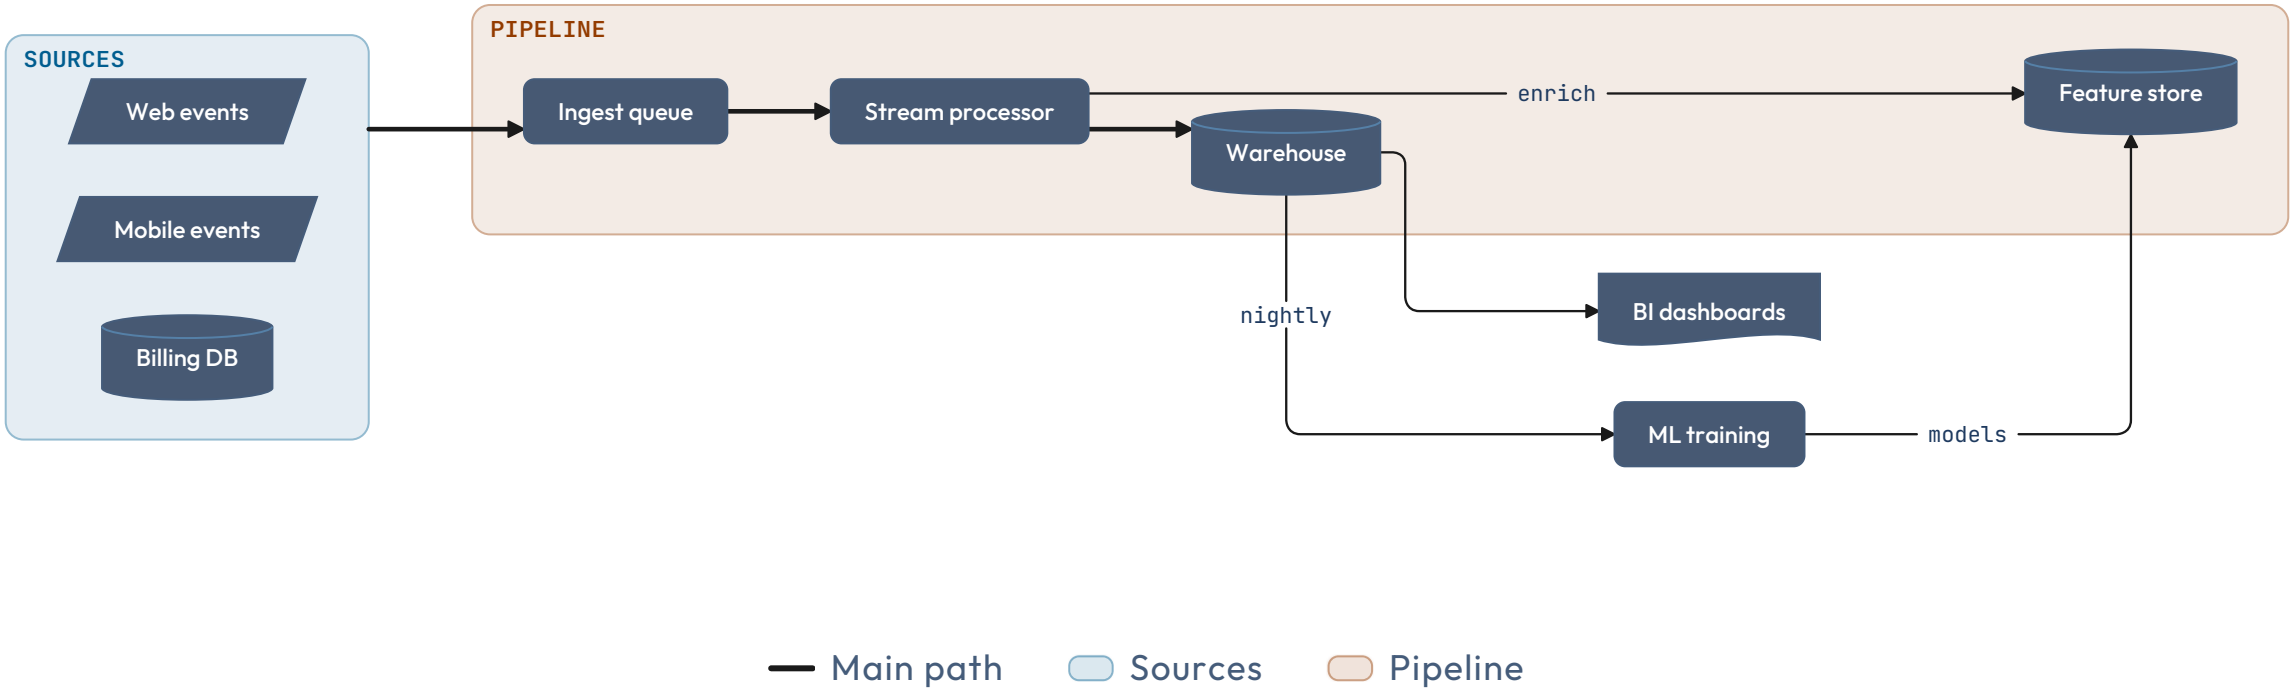

Three lines of reporting, one advisory line.

An org chart — `--` draws a line with no head, `&` fans out, `loose` stays out of the layout

Analytics

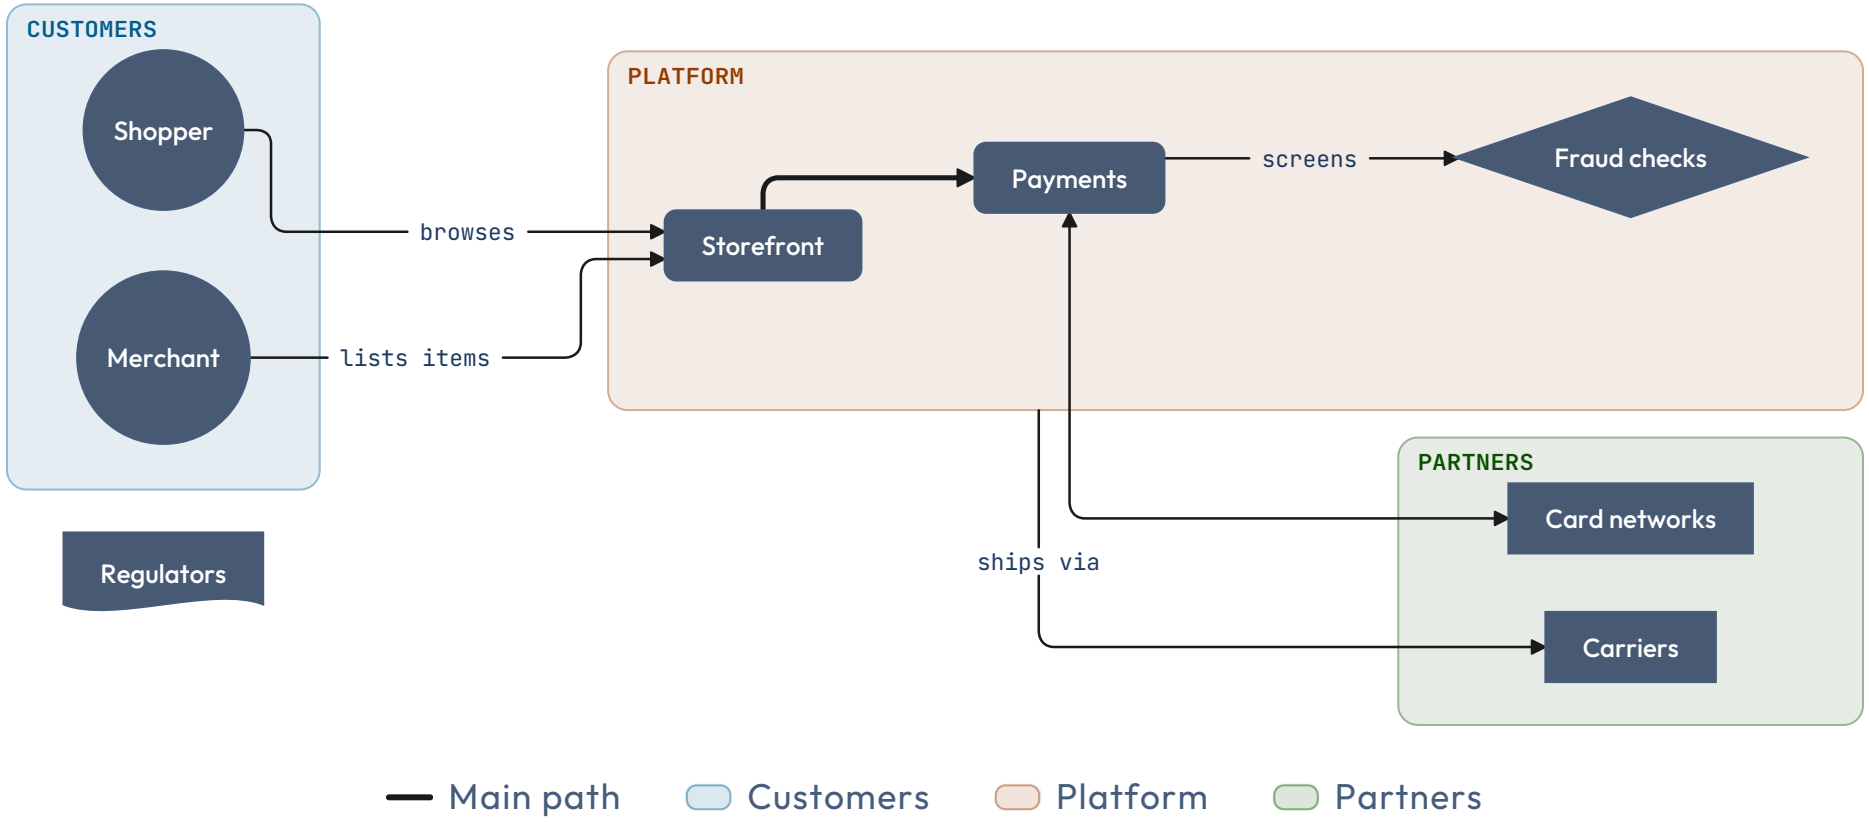

Every event lands in the warehouse within a minute.

A data flow — groups, the io, cylinder and doc outlines, a line out of a group

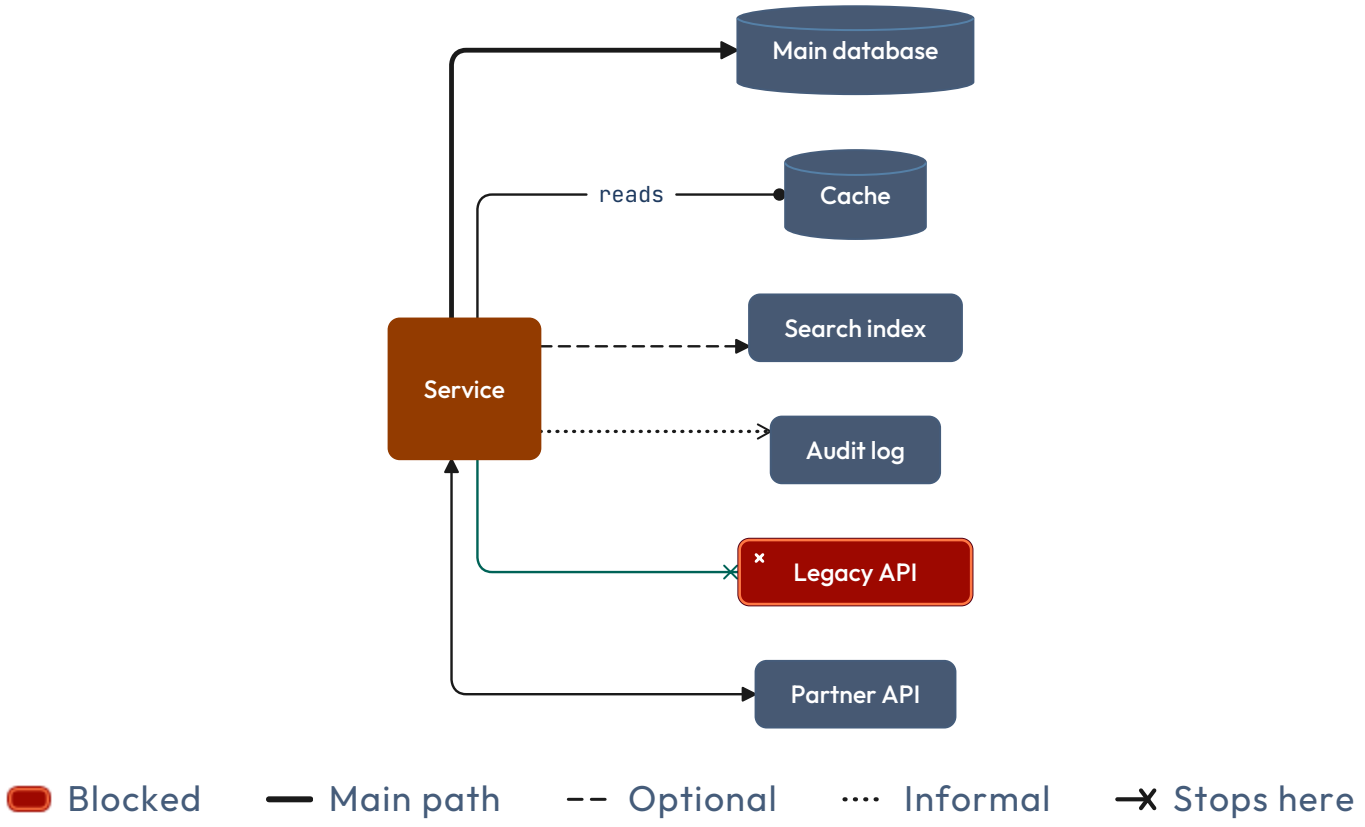

Platform

Payments sit between four parties.

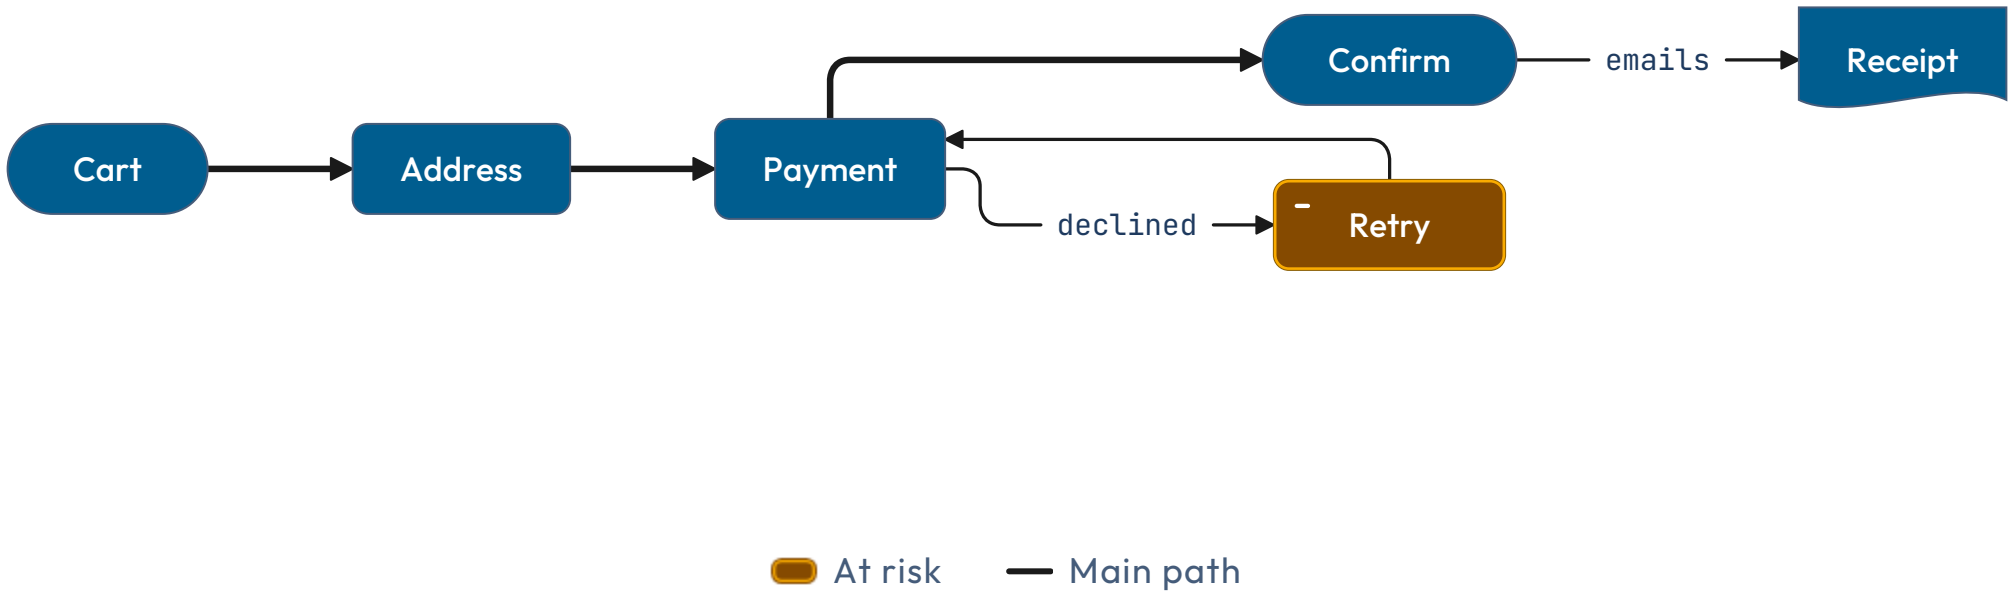

Line vocabulary

What a line says is in the arrow, how it looks is in the span.

Checkout

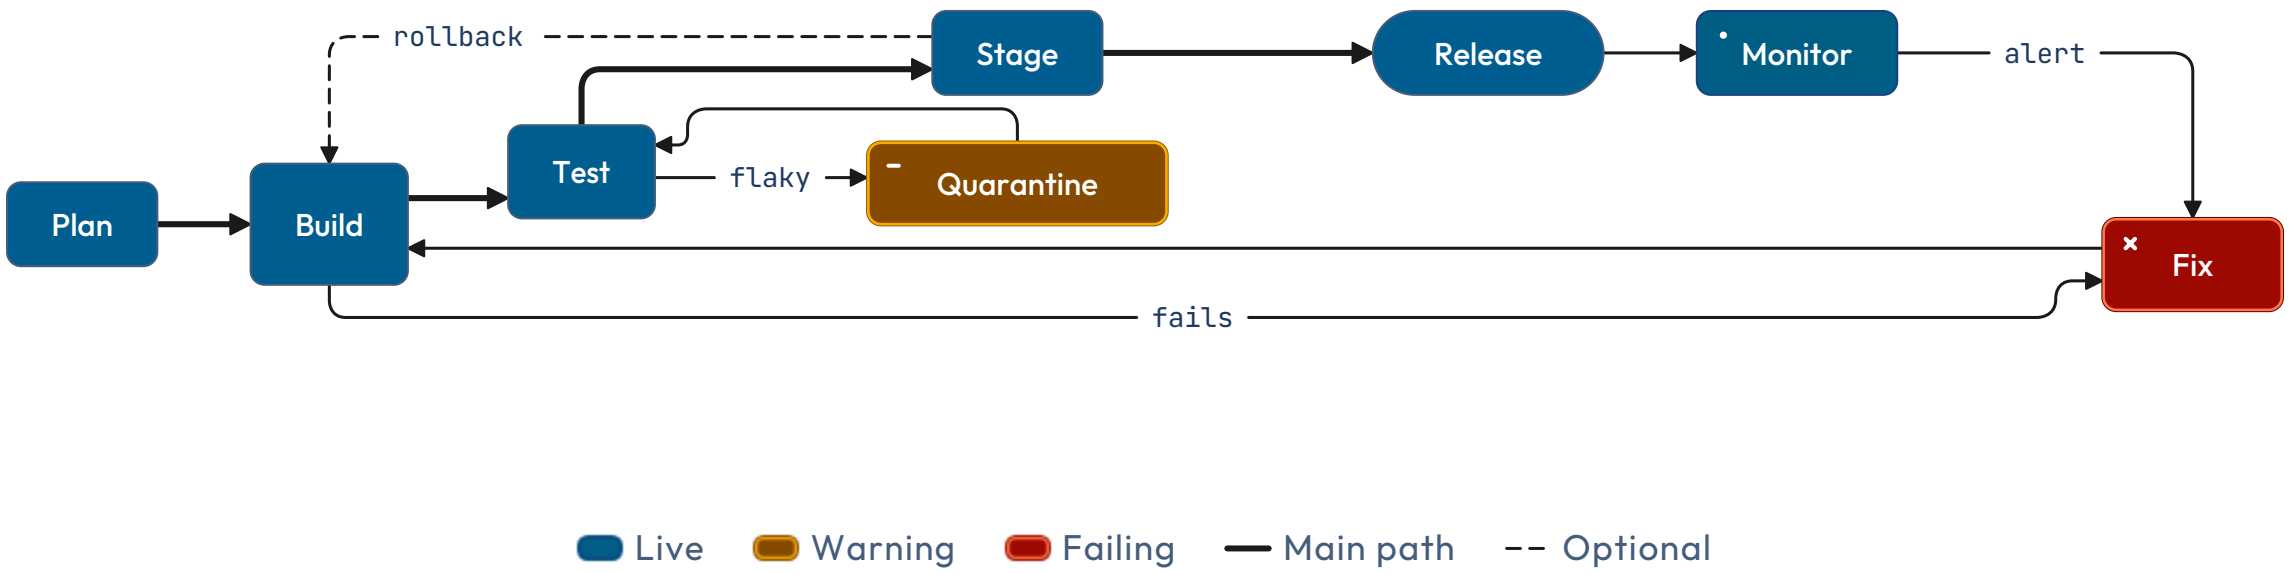

The same grammar reads a flat list.

Written flat — every row names its source, and the chart is the same as the nested form

Release train

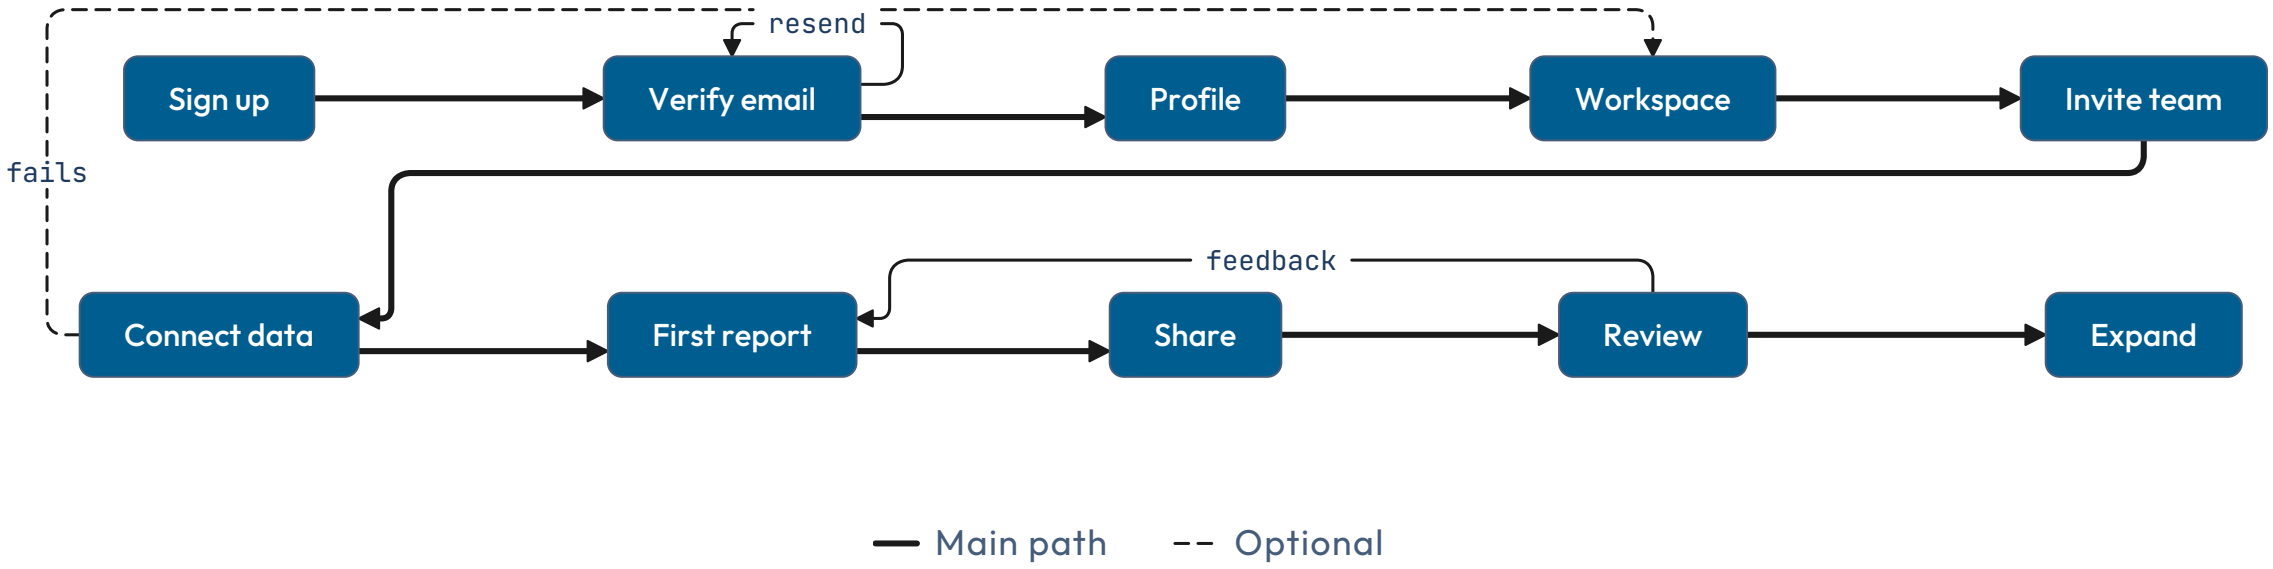

Compact spacing buys the type back on a dense chart.

Every failure returns to Build; nothing reaches Release without a green Stage.

Onboarding

A long flow wraps into rows instead of shrinking.

Ten steps on one line would set the type at a third of its size; three rows keep it readable.
