Watch where the flow leaks.

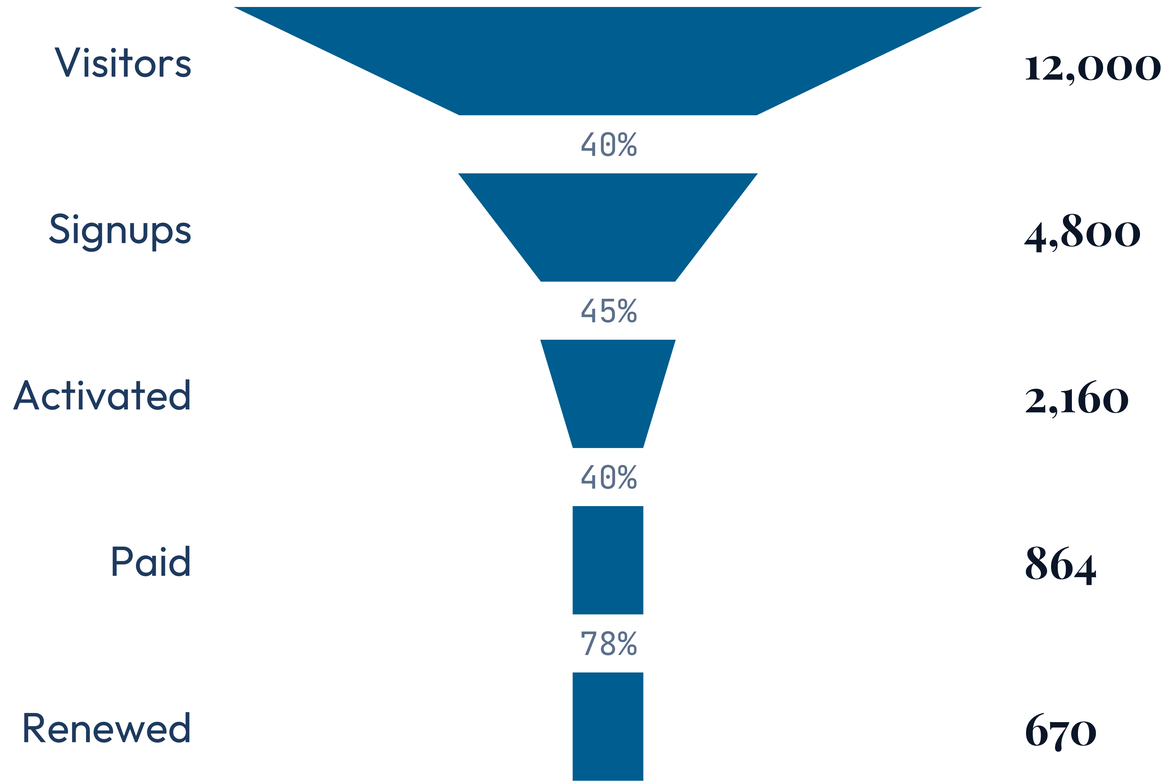

The pipeline slide for any narrowing flow — a sales or conversion funnel, a hiring pipeline, a grant or donor pipeline. Band width tracks each stage's value; the stage-to-stage conversion rate prints in the gaps, so the leak is the read.

Same shape, wherever the pipeline narrows.

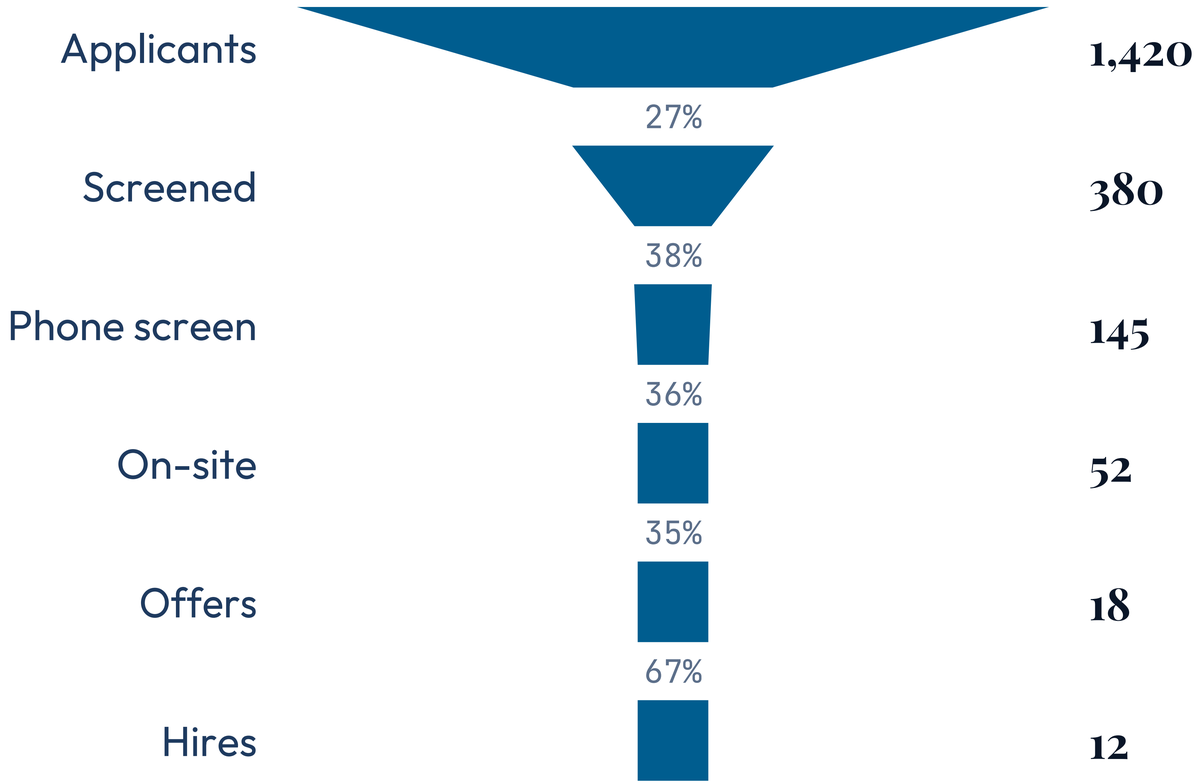

A funnel earns its trapezoids when every stage is a strict subset of the one above it and the audience needs to see *which step* loses the most.

- Author stages in flow order, widest first: `- Visitors \ 12,000``. The largest value sets full width; the rest scale to it.
- Three to seven stages read best. Two is just a ratio — use a `big-number`. A category breakdown that isn't a subset belongs in a `piechart`.

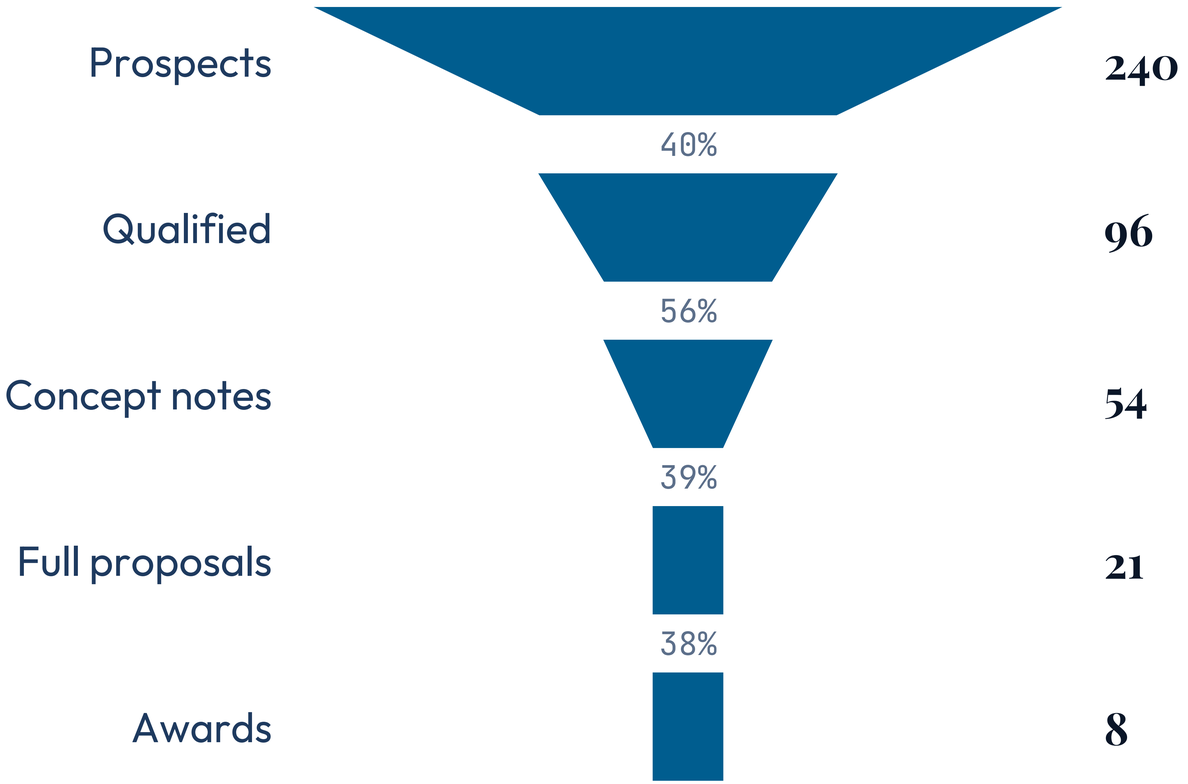

Where the signup pipeline leaks.

The hiring pipeline, role by role.

From prospect to grant award.

funnel

The narrowest gap is the story.

The widest band is rarely the point. Read the conversion rates down the gaps and present the steepest drop — that's the step worth fixing.
