Chart · gantt · sub-rows

Gantt lane packing

What a lane looks like when two tasks run at the same time.

Three tasks, one lane, two of them running together.

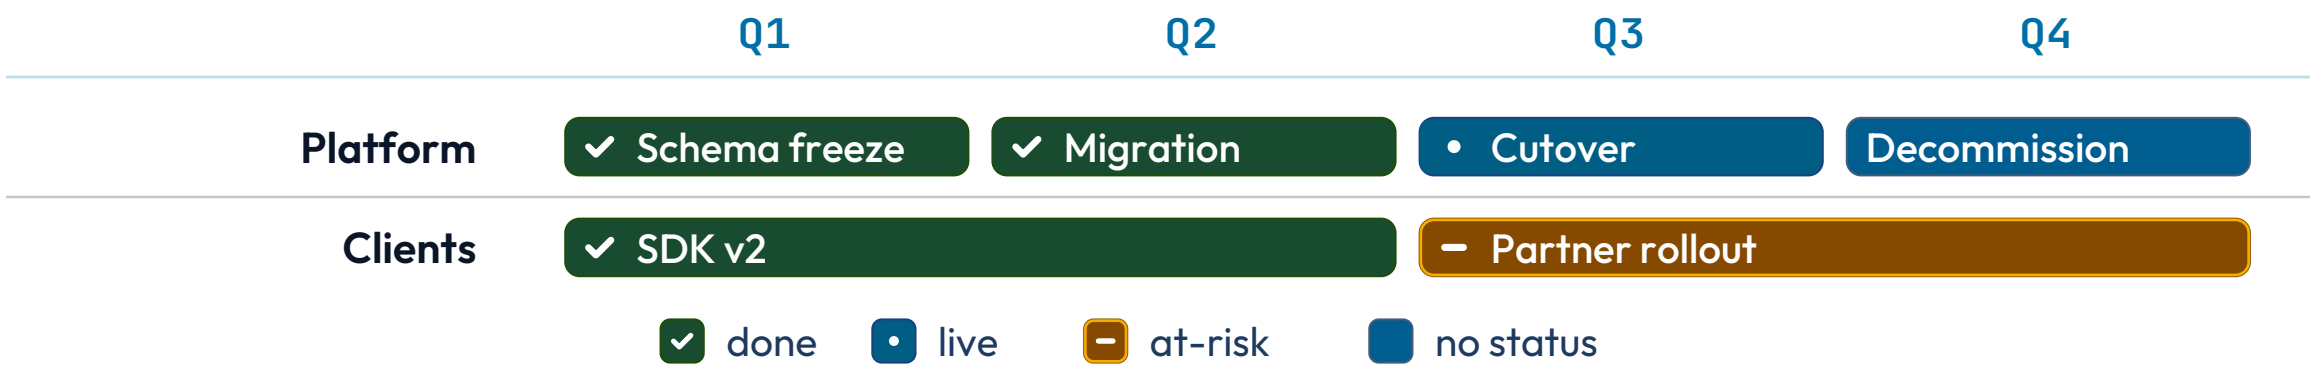

Scoring model v2 overlaps both its neighbors, so it takes a row of its own; the two that clear each other still share one.

Concurrency is the point — and now it is visible.

Tasks that clear each other still share a row.

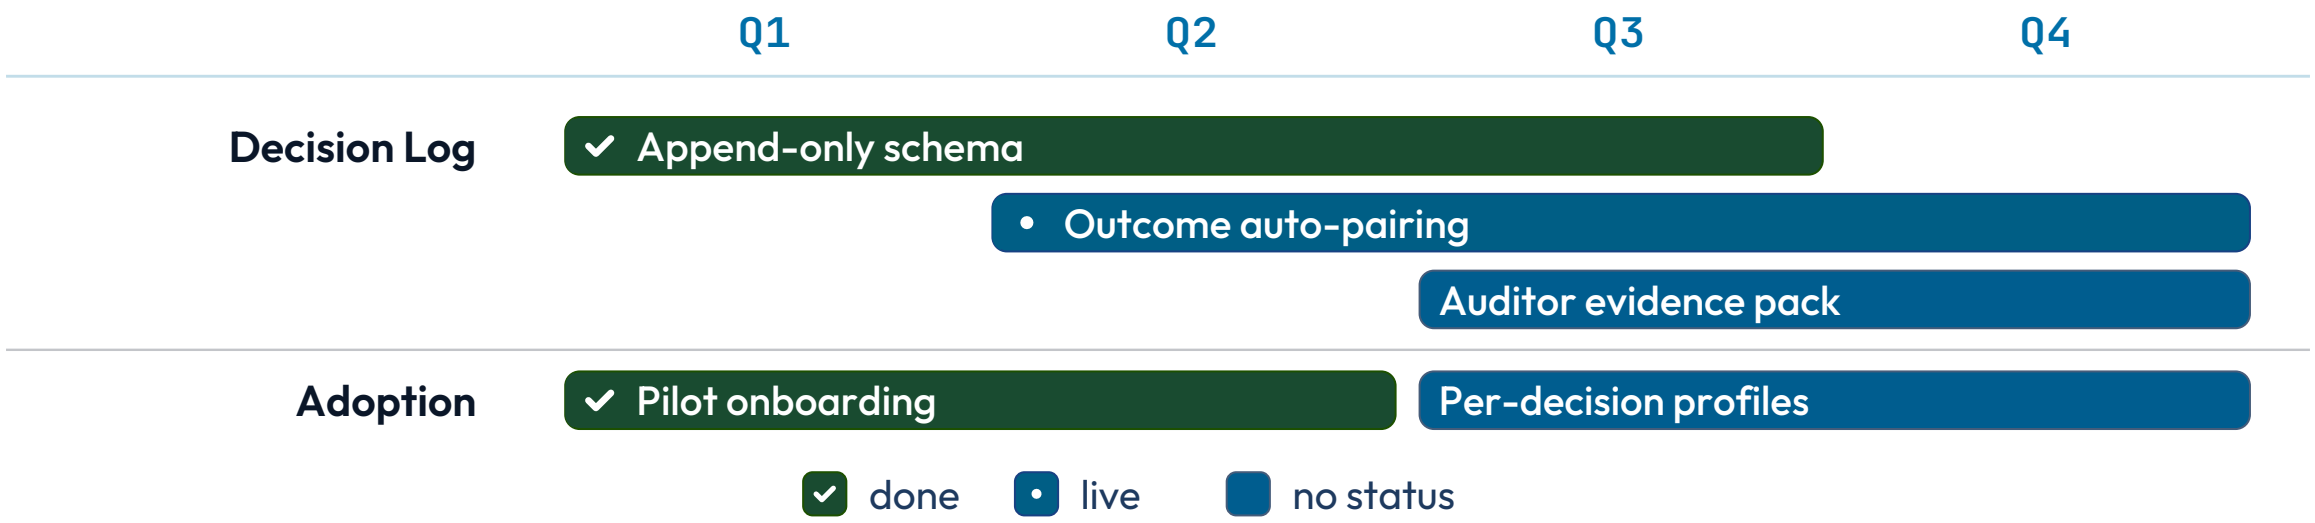

Packing only spends height where the data needs it. Nothing here overlaps, so every lane is one row — the same geometry these charts have always had.

A sequential lane costs no extra height.

When everything overlaps, every task gets its own row.

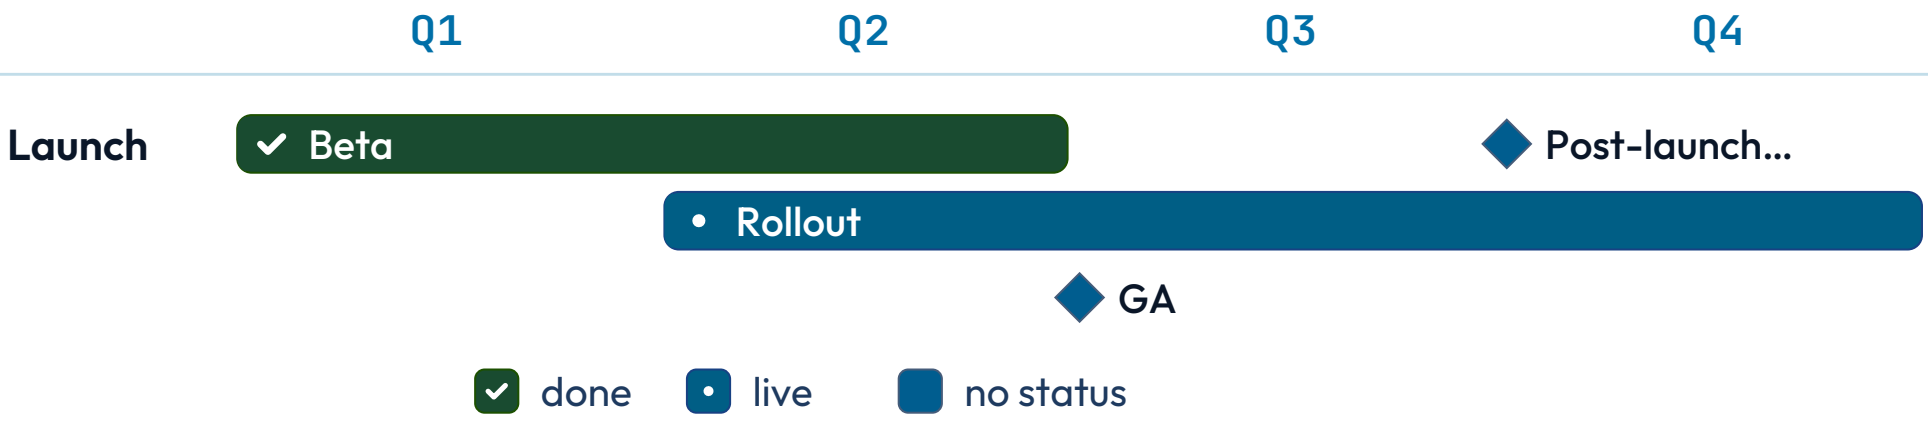

The decision log's three workstreams run across each other end to end. On one row the last one drawn would have been the only one visible.

Three mutually overlapping tasks earn three rows.

A milestone never sits on top of a bar.

GA falls inside the rollout's span. It is its own task, so it takes its own row and its diamond reads on any canvas.

A milestone inside a bar's span is a separate task.

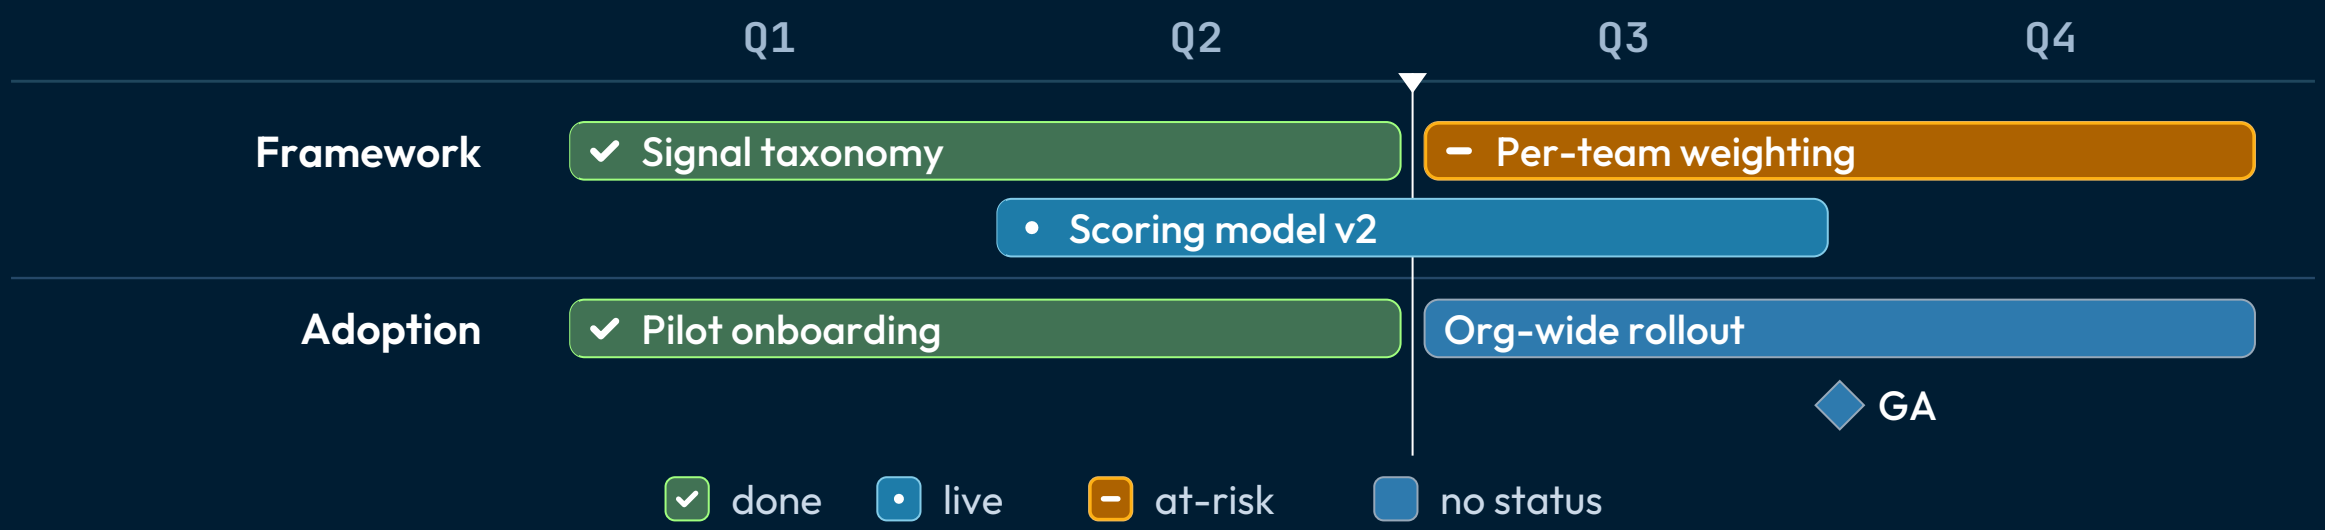

The chart keeps its size and grows taller.

Bars and captions are one fixed size on every gantt in the deck. More work makes the chart taller, never smaller — and past the capacity budget it overflows and the render names what was cut, rather than quietly scaling down until nobody can read it.

The now line reads as chrome on either canvas.

It takes the neutral every other reference line in the family takes, so it never wears the same ink as a `live` bar it crosses — and it sits behind the marks.

gantt lane packing

What changed.

`sub-rows` — tasks that overlap on the axis get their own row; ones that clear each other still share

`captions` — a caption's budget is the next mark on its own row, not the next task in the lane

`accent` — the bar's leading edge is clipped to the bar, so it cannot escape the corner

`key` — the swatch centers on the label it keys

`today` — a neutral reference rule, painted behind the marks

`budget` — the chart never shrinks to fit; past its capacity it overflows and says so
