Lattice · inline pills

A pill is a property of the value.

Shape and color travel with the thing they describe, not with the slide.

What changed.

`{LABEL}` inside inline code becomes a pill; `[x]` becomes a mark.

`tag` `chip` `circle` `chevron-right` name the shape.

`c1` – `c12` name a categorical slot, never a color.

Plain inline code is untouched, so nothing existing moves.

One slide can hold four different statuses.

01	Settlement engine	Shipped and load-tested	STABLE
02	Ledger migration	Cutover paused for review	PARTIAL
03	Reconciliation	Design agreed, not started	QUEUED
04	Legacy batch	Retired this quarter	CLOSED

One ledger, four different statuses — no variant on the slide.

Before, the slide chose the look.

01	**Settlement engine**	Shipped and load-tested `STABLE`
02	**Ledger migration**	Cutover paused for review `PARTIAL`
03	**Reconciliation**	Design agreed, not started `QUEUED`
04	**Legacy batch**	Retired this quarter `CLOSED`

The same rows, before pills — the register variant tinted every pill the same.

Eight shapes cover the vocabulary.

01	Capsule and tag	DEFAULT TAG
02	Bordered and chip	BORDERED CHIP
03	Round and pointed	3 NEXT BACK
04	Decision marks	! ?

A pill sizes itself LIVE

In a heading it is large. In body text it is the metadata size, the same as STABLE in a table cell.

- `sm` and `lg` still work: MINOR · NORMAL · MAJOR
- They scale the automatic size, so they read the same way in every context

— Note: in a below-note or a footer a pill is small, like DRAFT here.

Ordinary inline code is untouched.

01	A function	`getUserId()` renders as it always did
02	A CSS selector	`[data-mark]` and `:root` are not pills
03	An object	`{ ok, scene }` is code, not a label
04	A near-miss marker	`[~]` is not one of the six, so it stays literal
05	An escape	`{LIVE}` and `[x]` show the literal; `\[a-z]` keeps its backslash

Code stays code — the escape is doing nothing at all.

A mark goes wherever inline code goes.

01	Settlement engine	✅ signed STABLE — and `[data-mark]` stays literal
02	Ledger migration	Cutover paused for review ⛔
03	Vendor audit	Evidence rejected by the auditor ❌
04	Data residency	The regulator has not ruled ❓
05	Reconciliation	Not started ○
06	Legacy batch	Out of scope this quarter ⊘

Brackets make a mark, braces make a pill — one vocabulary, two positions.

When NOT to reach for a pill.

A sentence

A pill is one word, two at most. If it needs a clause, it belongs in the row's description where it can wrap.

A word in a circle or diamond

Both are only as tall as a capsule, so they hold a digit or a mark. `lint:deck` says so rather than refusing the deck.

A color that means something

`c1`–`c12` are ordinal slots, not colors. The same slot is sky blue on indaco and deep red on burgundy — pick a slot for contrast, never to say "green means good".
