list takeaway numbered · absorbs list-criteria

Criteria live in `list` now

A nested gloss under each item stacks a muted reason line under a bold lead, and the number keeps one size.

Every "verified" names the surface it ran on and carries proof from it.

01 **Name the surface**

The real browser, the real export, the real device.

02 **Attach the artifact**

A screenshot, a log, a measured number from that surface.

03 **Say "unverified" out loud**

When the real surface is out of reach, write it down.

04 **Treat "CI is green" as partial**

It proves only what CI actually runs.

Criteria are gates: clear them in order.

01 **State the bar**

Each criterion is a pass-or-fail line, not a preference.

02 **Order by veto power**

The criterion most likely to kill goes first.

03 **Keep the list short**

Three gates decide; six gates stall.

Five gates is the most one decision should clear.

01 **The first gate**

A criterion at the hard budget states the bar and the evidence that clears it, in one breath.

02 **The second gate**

Twenty-two words is the ceiling; this clause is written to sit just under it, deliberately.

03 **The third gate**

Middle gates read fastest — put the contested one here.

04 **The fourth gate**

Attention thins; shorten the clauses as the list descends.

05 **The fifth gate**

The stop. A sixth gate means the bar is a rubric, not a decision.

Four requirements every decision system must meet.

01 **Speed**

Decisions close inside their window.

02 **Auditability**

Every decision above the threshold carries a traceable rationale.

03 **Adoption**

Weekly use, or calibration never runs.

04 **Calibration**

It has to improve over time.

Bullet source (-) renders the same as numbered source (1.)

What the pilot showed.

Adoption beat the target

90% weekly use across the sales org inside four weeks.

Migration lost nothing

Two years of closed history moved with zero data loss.

Trust came back

Leadership now reads one pipeline number.

Criteria are gates: clear them in order.
