Mermaid · motion

A diagram builds in, like a chart

This deck sets `motion: on` and nothing else. Every Mermaid diagram in it now builds the way a chart does: the containers first, then the boxes, then the arrows between them, then the words.

What changed, and where it runs

DIAGRAM MOTION · MOTION: ON ANIMATES A MERMAID DIAGRAM LIKE A CHART

A Mermaid diagram is an SVG, but it declared no motion roles, so `motion:` passed it by.

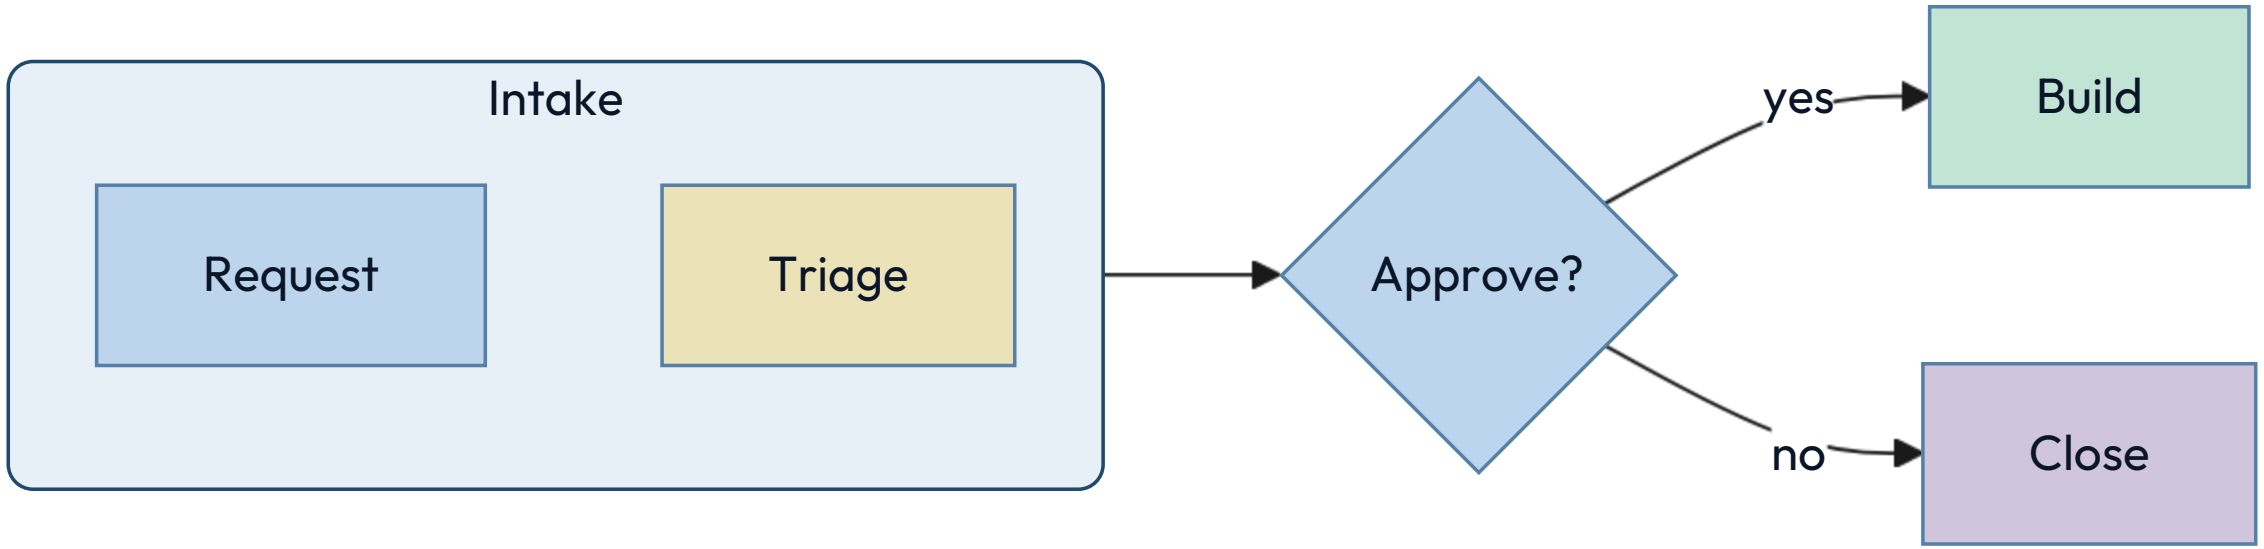

The runtime now tags each drawn diagram with the roles a chart emits. It builds in the Playground, the Studio, Present and the HTML player.

KEY INSIGHT

The PDF is a still, as for every chart. Open the deck live to watch it build.

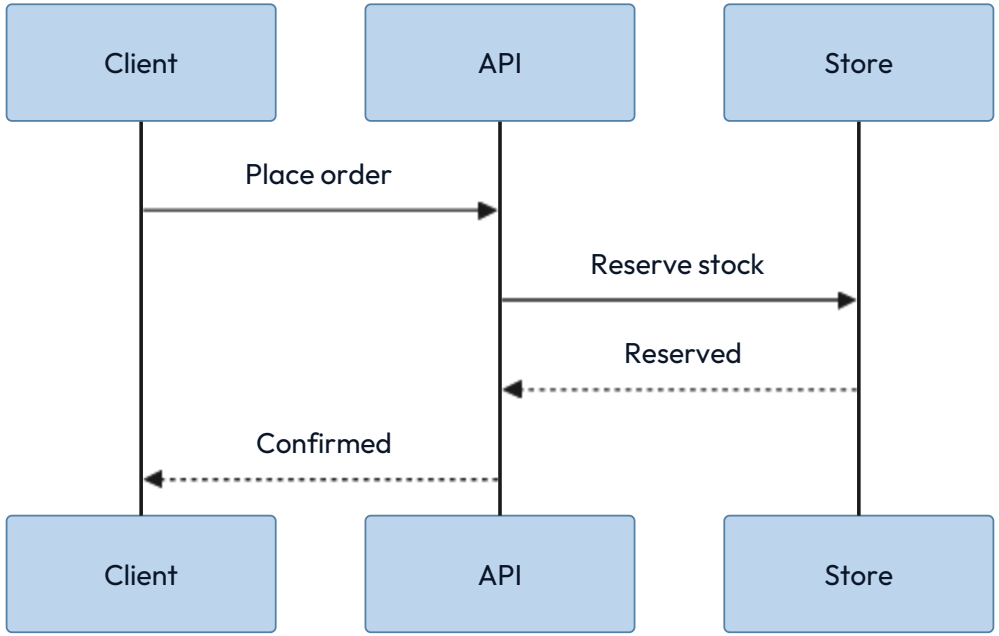

Flowchart · boxes, then arrows

A subgraph frames the boxes before the arrows arrive.

Sequence · actors, then messages

The participants stand up, then the messages run in order.

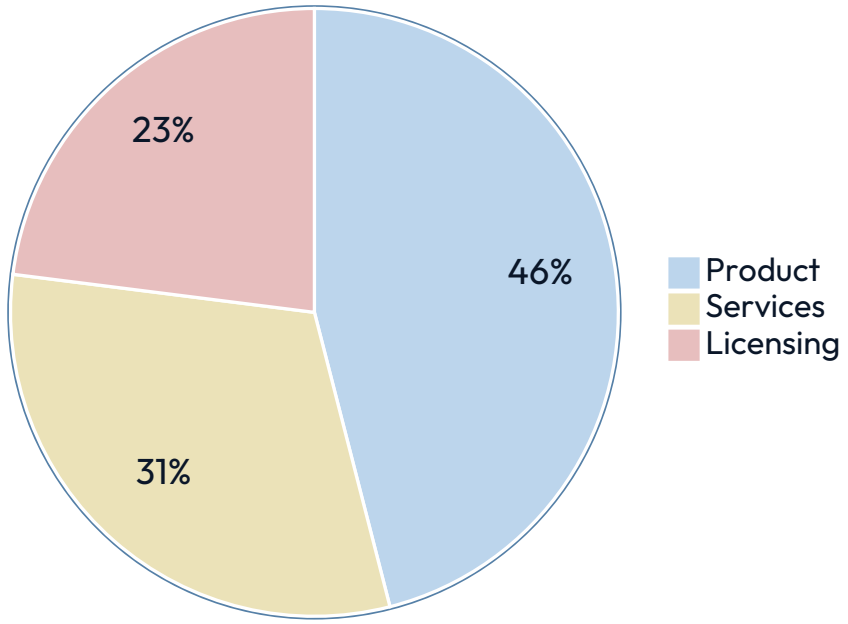

State · same build

Every family on Mermaid's graph renderer builds the same way.

Pie · the disc arrives whole

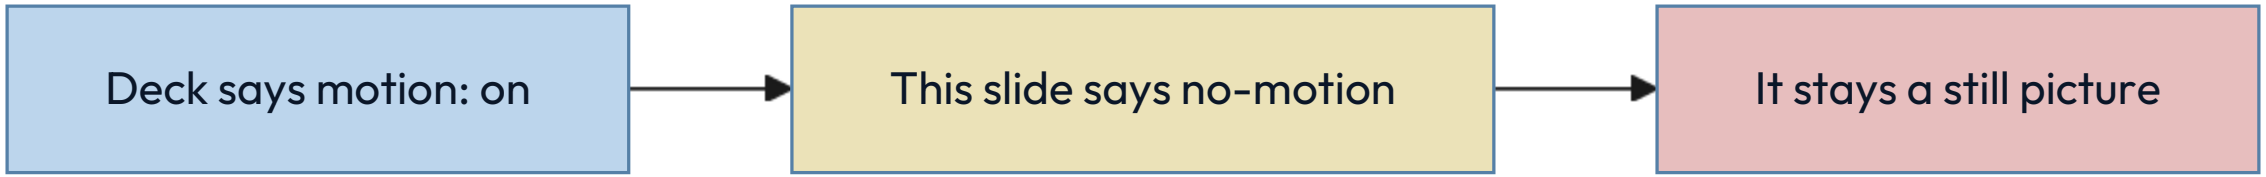

A pie reveals as one disc, exactly like a chart pie.

Opt out · one slide

DIAGRAM MOTION · MOTION: ON ANIMATES A MERMAID DIAGRAM LIKE A CHART

A slide can still opt out with no-motion.

What stays a still

A family Mermaid draws with a renderer we have not mapped, such as a user journey, gets no roles and stays a still picture.

Viewers who ask the OS to reduce motion see every diagram settled, with no entrance, as they do for charts.

KEY INSIGHT

Mapped: flowchart, state, class, ER, mindmap, sequence, pie, gantt, XY chart, quadrant, git graph and timeline.
