Diagram · nested fences

A diagram under a list item

A Mermaid fence at the second level of a list draws, in the PDF and the player, as it does in the Studio.

A diagram under a two-digit step

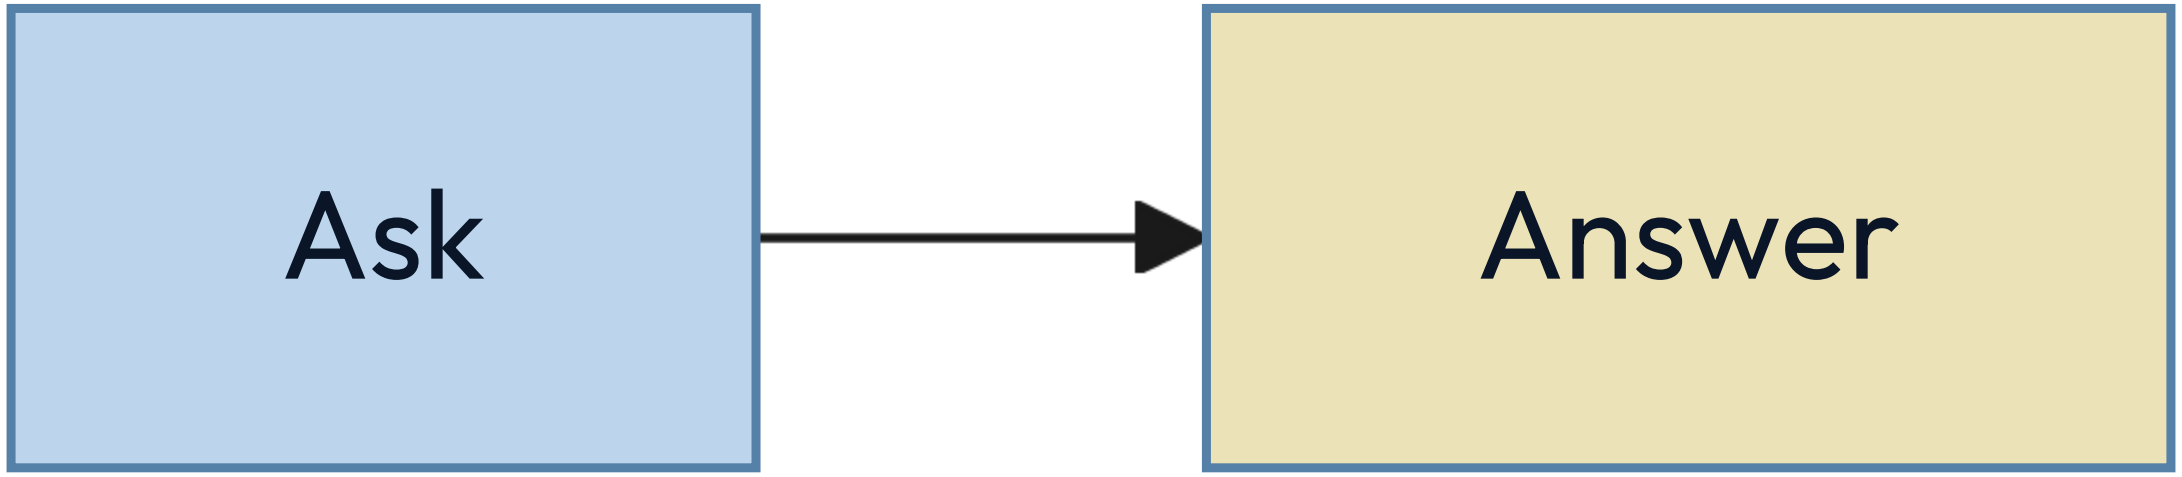

9. Ninth step.
10. Tenth step, with its diagram:

11. Eleventh step.

A plain fence after it

Every later figure keeps its place.

Under a bullet, the shape that always drew

- First point, with its diagram:

- Second point.

What the CLI reads now

- A fence under a `>` quote
- A fence four spaces in under `10.`
- Any fence the engine itself marks as Mermaid

An indented code sample, a fence quoted inside another fence and a `$$` math block stay what they are.

Try it

Write a diagram where it belongs in your outline, then export:

```
lattice deck.md deck.pdf --player
```

The PDF and the player draw every diagram, in the order you wrote them.
