# The PDF that opens everywhere

The deck stays vector — selectable text, embedded fonts, crisp at any zoom. Only the SVG photos become pixels, and only because some viewers demand it.

*The problem*

# A shared deck gets opened on a phone first — the export has to survive the strictest viewer it meets.

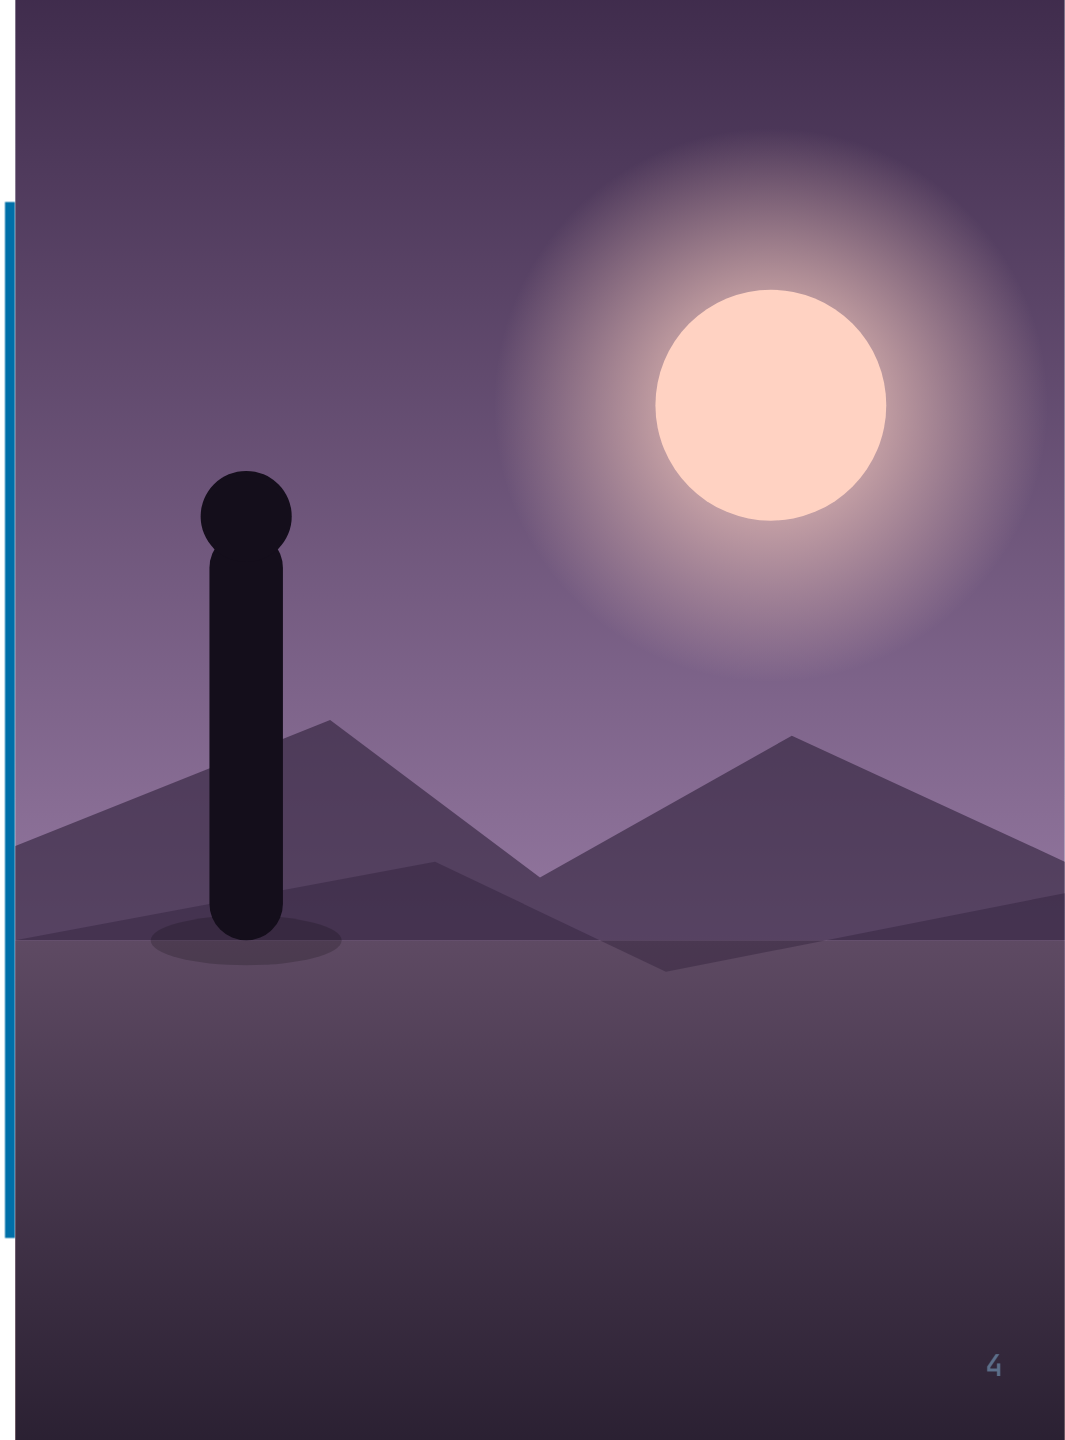

## A panorama earns the full frame.

On iOS, this full-bleed SVG used to draw only a top band over bare canvas. It now exports as a 2× raster twin — a plain image XObject every viewer supports.

# Built for the long climb.

The tall photo column vanished outright in Quartz viewers. Same fix: the SVG is rasterized at export time, at twice its placement size, aspect intact.

# What the exporter now does by default

- Rasterizes SVG images
  - Every placed photo and inline `![](photo.svg)` becomes a 2× PNG twin in the PDF — text and layout stay vector.
- Keeps real vectors vector
  - Mermaid diagrams, charts, and logo marks are inline SVG: they print through the page's own paint path and stay selectable-crisp.
- Leaves you an out
  - `--keep-vector-images` restores the pure-vector export when you control the viewers.

# Two delivery flags for the artifact itself

- `--raster`
  - One full-bleed 2× JPEG per page — maximum compatibility, at the cost of selectable text. Notes, `--present`, and `--embed-source` still apply.
- `--embed-source`
  - Attaches this deck's Markdown inside the PDF, so the artifact alone round-trips back to an editable deck. Opt-in: it ships your source, speaker notes included.

*Export · portability*

# Beautiful is the floor. Portable is the contract.
