Imagery · Anima poster still

The scene layout — motion, frozen for paper

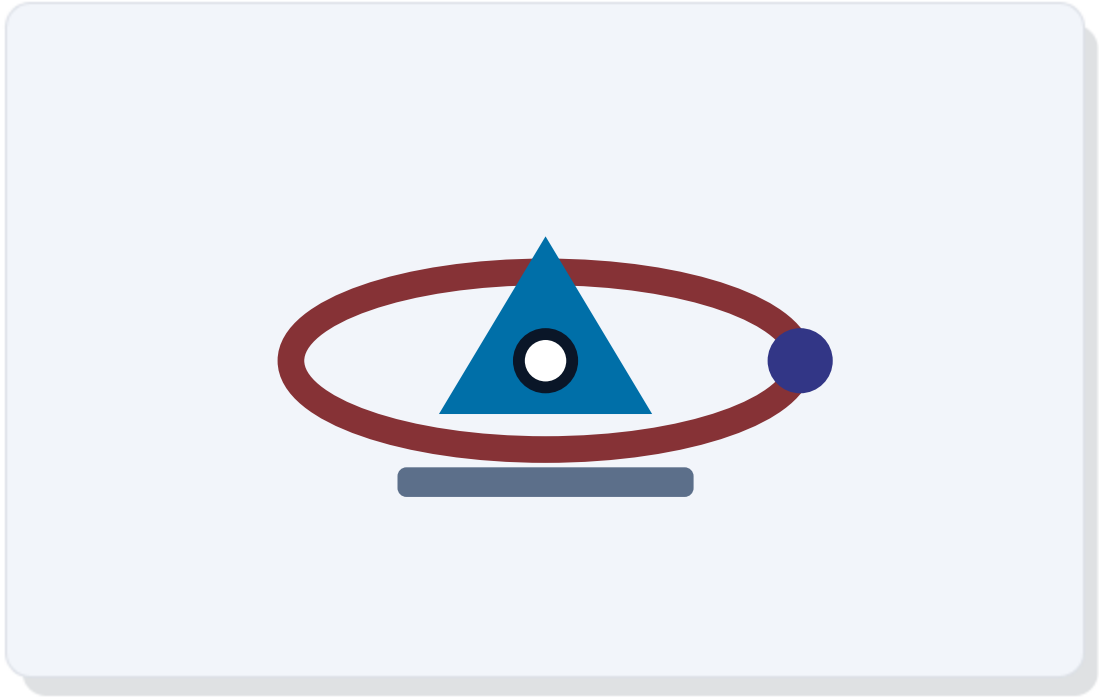

A `scene` puts an Anima motion scene on a slide as its poster still. The PDF shows the still; the live surfaces animate it. Like `image`, it reads the poster's shape and resolves the composition for you.

The premise

The poster is an inline, palette-blind SVG — so it recolors with the theme and bakes crisp into the PDF.

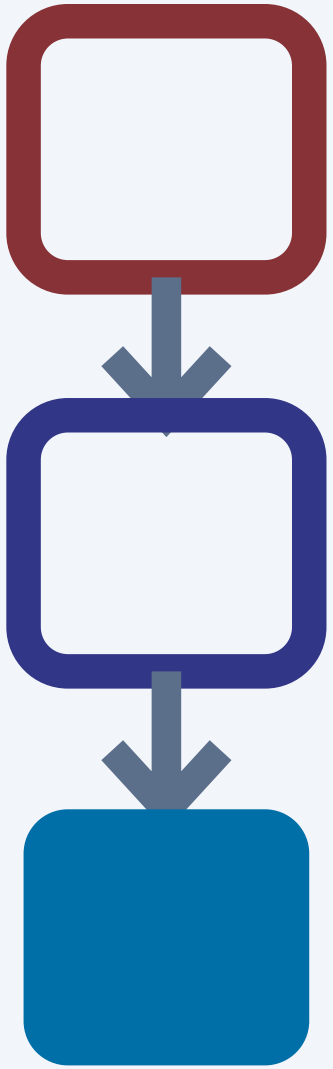

The rotor turns inside its fixed housing.

A moderate-aspect scene gets the **clean** default — a card shaped to the poster, the claim running alongside. In the deck it turns; on paper it holds the hero frame.

The pipeline assembles, stage by stage.

An extreme aspect would waste a card, so the resolver upgrades to **split** — a full-height column that shows the whole tall scene, the argument leading beside it.

The signal flows left to right, gated at each hop.

When the scene already matches the canvas, **spotlight** lets it own the frame — the message rides a solid card, so legibility never depends on the art.

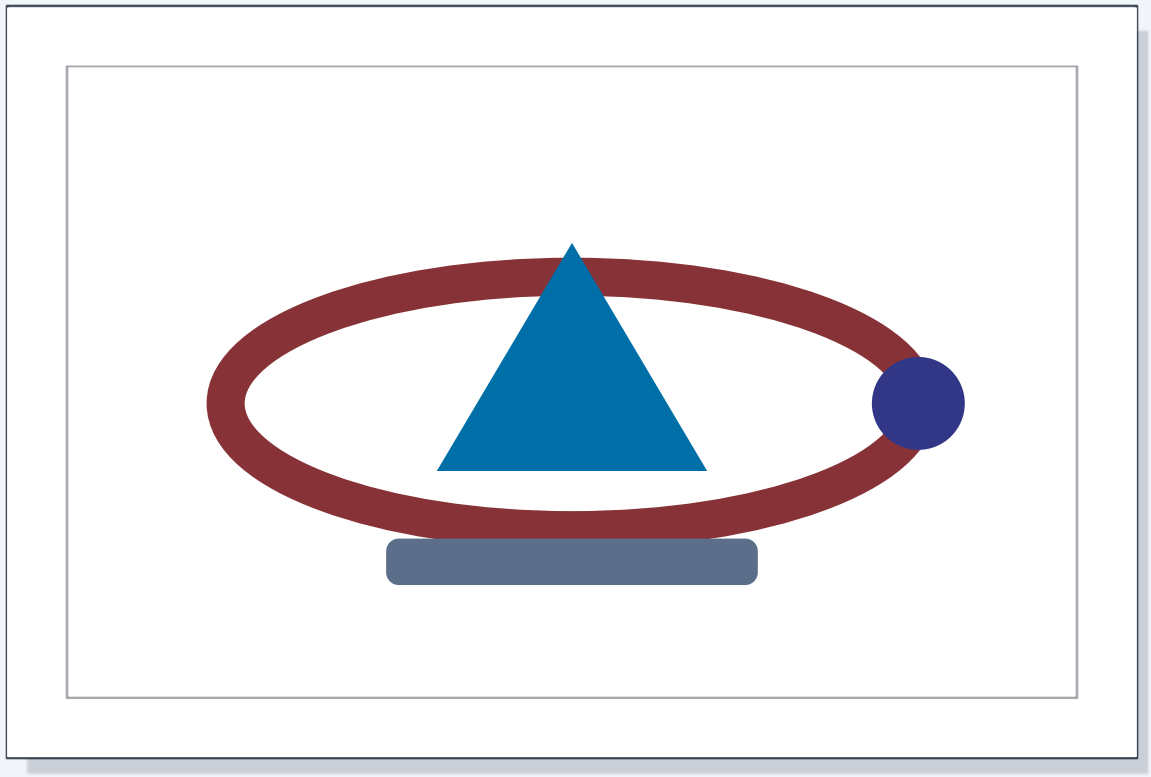

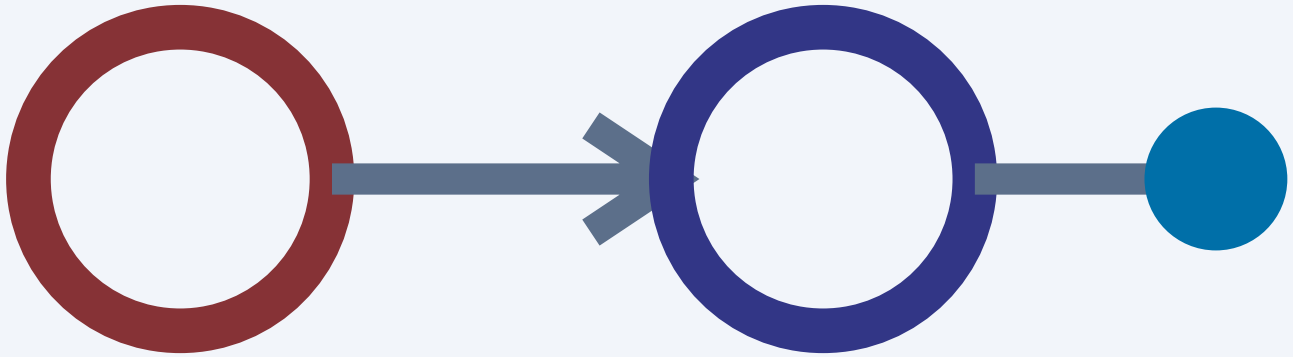

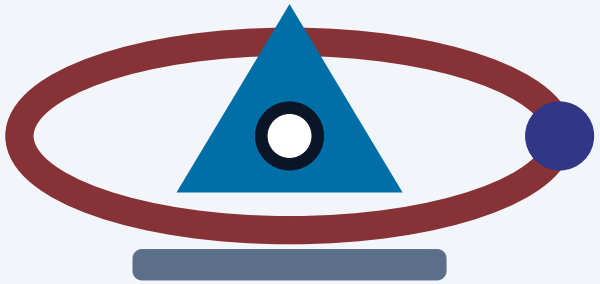

Exhibit 1 — the mechanism, contained.

gallery stays opt-in: it mats the whole scene on a wall with a placard below — the natural exhibit look when the shape itself is the point.

Order is the argument.

statement rides the title on a themed band below the scene — the editorial moment you reach for when the motion itself is the headline.

Read the depth before the label.

`mirror` flips the sides: the scene anchors from the left, the text leads from the right — the same resolution, the other hand.

One markdown. Six compositions. Recolors to any theme.

`<!-- _class: scene -->` *+ an inline poster SVG. The layout reads its shape and does the rest; the live animation waits in the HTML deck.*
