--seq-50 … --seq-900 · canvas-relative poles

The ramp learns which canvas it is on.

A higher stop is always the louder one — which direction that is depends on the canvas.

One direction cannot serve two canvases.

The old derivation

Stops 600–900 shaded toward **black** on every canvas. On a near-black slide that walks toward the background.

What it cost

Eleven palettes painted weight-4 words at 1.66–3.19:1, under the 3:1 bar for large text.

Why no gate saw it

The base derives these stops from the anchor, so a palette-token audit never scored one.

Weight reads as heat on a light canvas.

SIZE = FREQUENCY

less

The stops interpolate toward a pair, not toward black.

`--seq-pole-low`

The quiet end. Stops 50–400 recede toward it — white on a light canvas, black on a dark one.

`--seq-pole-high`

The loud end, mirrored. Both are `light-dark()` pairs, so a `_class: dark` slide flips the ramp for free.

Two surfaces pin them

`carbone` keeps one dark canvas in both schemes, and printed paper is light whatever the deck is.

Poles fix the direction. The anchor owns the headroom.

Solve the arm against the stop

A dark anchor that restates the near-white `--accent` leaves `--seq-700` nowhere to climb.

Mid-range, hue untouched

All fifteen dark arms sit at OKLab L 0.68 — hue and chroma untouched, every stop clear of 3:1.

Checked where it lands

`composed-contrast` scores the derived stops on the real canvas, in both cascade orders.

A brand hue is not a stop on a scale.

word-cloud spectrum

An accent's lightness is whatever the palette needed for an accent, so weight 4 out-shouted weight 5 on 20 of 38 palette × canvas pairs. The heaviest tier reads `--seq-900` now.

38 of 38 encodings ordered.

Tiers below the 3:1 bar: 13 down to 0 · tightest adjacent step: 0.012 up to 0.096 OKLab
