Fix · verdict-grid narrow form

Stacked verdict cards follow the cards register

In a narrow pane the verdict grid goes to one column. Its cards now sit where `cards:` puts them.

By default the stack sits as a centered band.

A 35% pane is too narrow for two cards a row, so the grid stacks. Each card keeps its content height and the band sits in the middle of the pane. Before this fix every card stretched to fill the pane, whatever the register said.

Stretch shares the height among the cards.

Under `cards-stretch` each card grows to an equal share of the pane, and its content sits centered inside it. This is the one register that fills, and before the fix a pane never applied it: the pane set two of the register's four values.

Top puts the stack under the pane's top edge.

Under `cards-top` the cards keep their content height and start at the top of the pane. The spare height collects below the last card.

Spread puts the spare between the cards.

Fits our controls. This is the pick.

Under `cards-spread` the spare height is shared out as even gaps around the cards, so the two options read as separate decisions rather than one block.

A lone option on its own page still fills it.

A portrait deck shows one verdict card per page. A member alone on its page claims the stage (the split run's lone-member rule), so a portrait export is unchanged by this fix: 0 of 965 slide images moved across every deck with panes and the verdict-grid and matrix-2x2 galleries, at hd, portrait and mobile.

KEY INSIGHT

The register places a stack of two or more cards. One card is the page.
