Lattice · Feature deck

A state machine that branches.

A chain keeps its reading order. A fan-out gets a real graph layout.

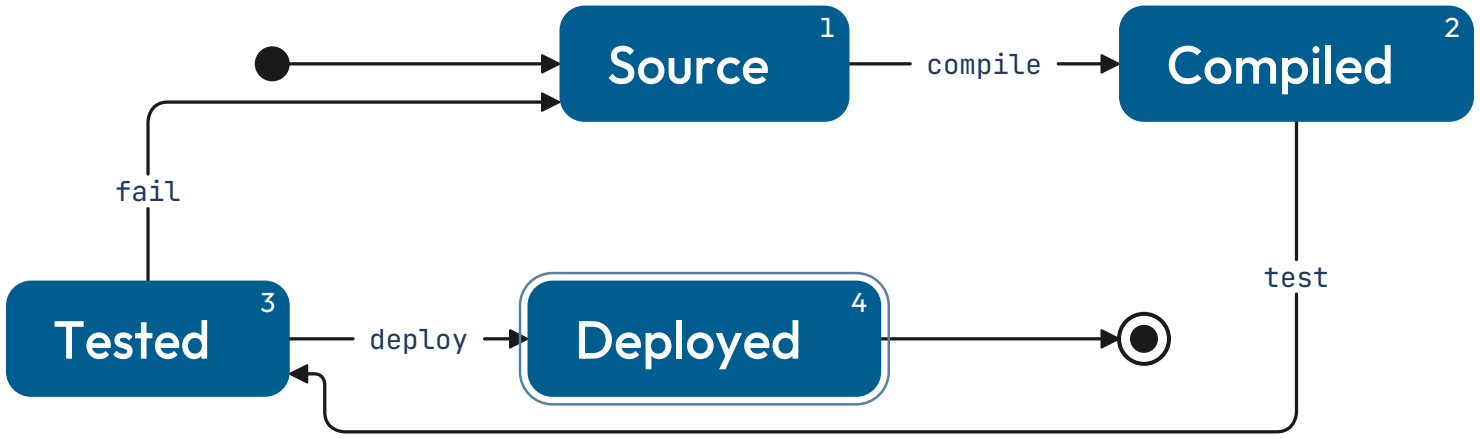

The rule

A chain reads `1, 2, 3` in order. A machine that branches is re-ranked.

Chain

A chain keeps its order.

One outgoing edge per state — reading order already is the right answer.

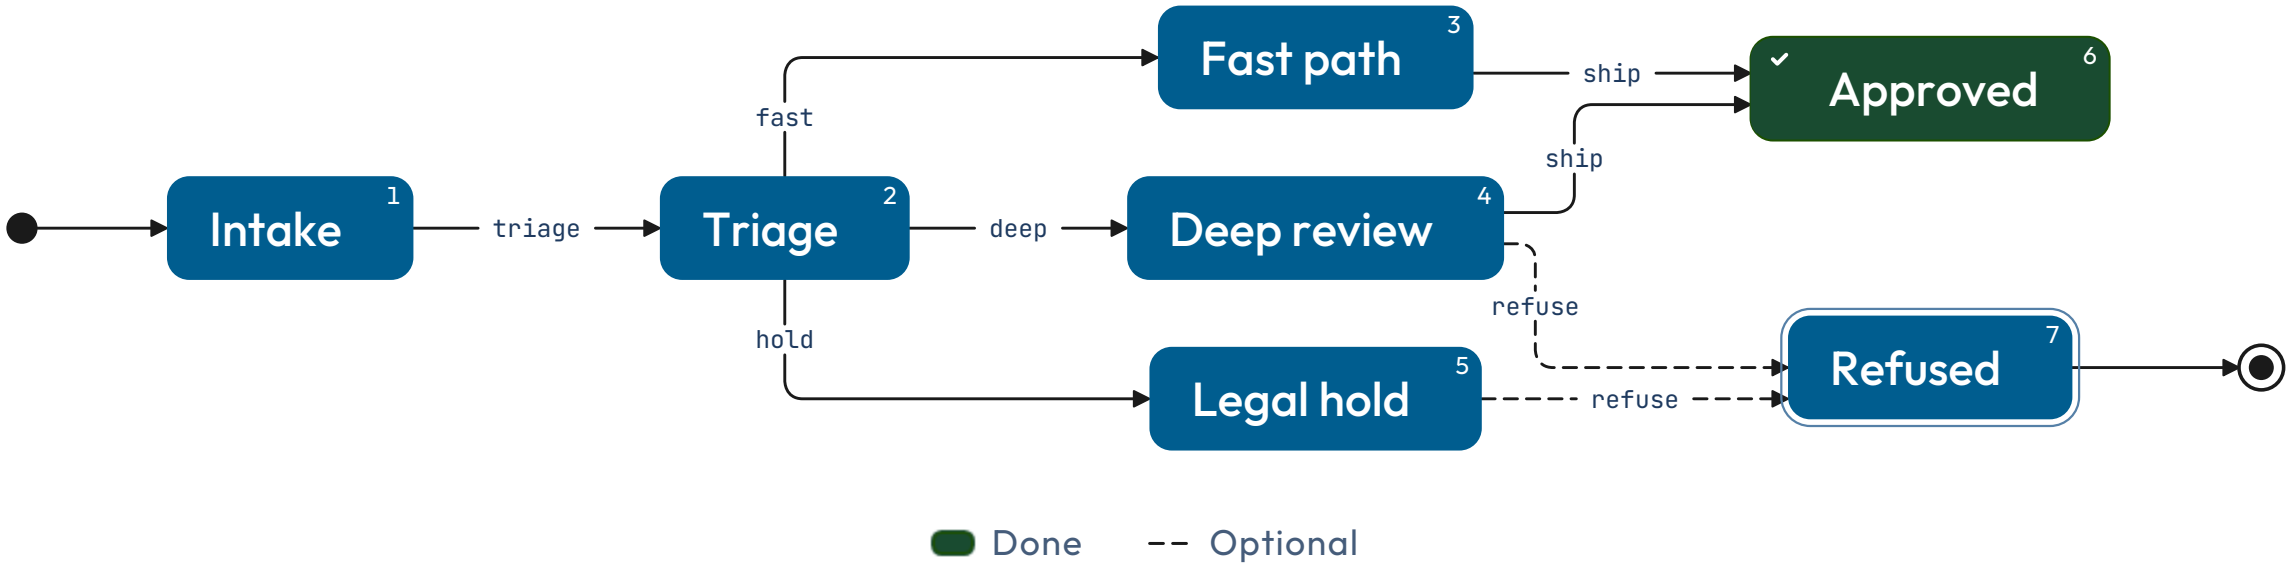

A long chain wraps onto a second row rather than shrinking — the order still reads left to right.

Fan-out

Three ways out of one state.

No single column can show this; the states would read as a sequence.

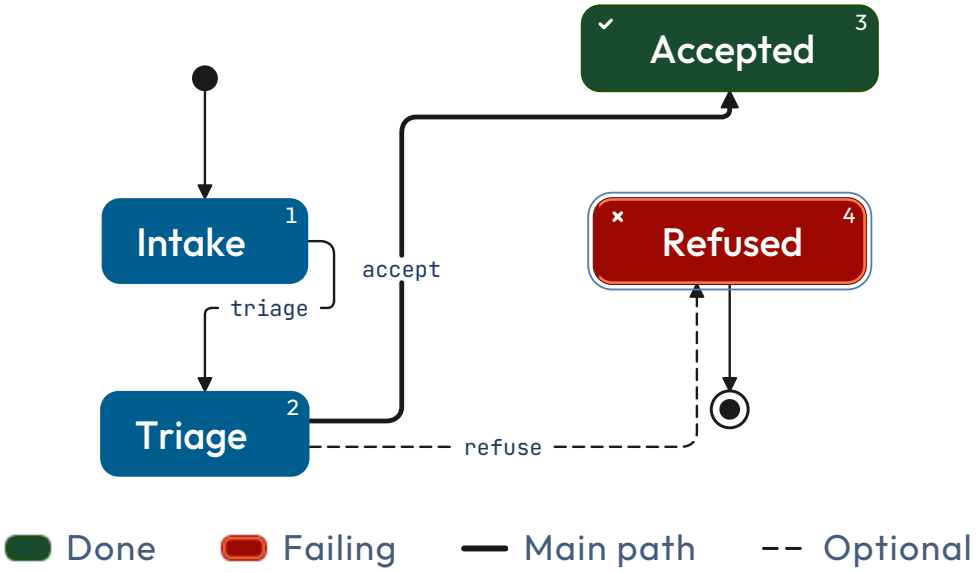

The badges still show the list order; they no longer dictate the row.

Top to bottom

The same machine, stacked.

Direction is the author's call — `lr`, `tb`, or leave it to fit the stage.

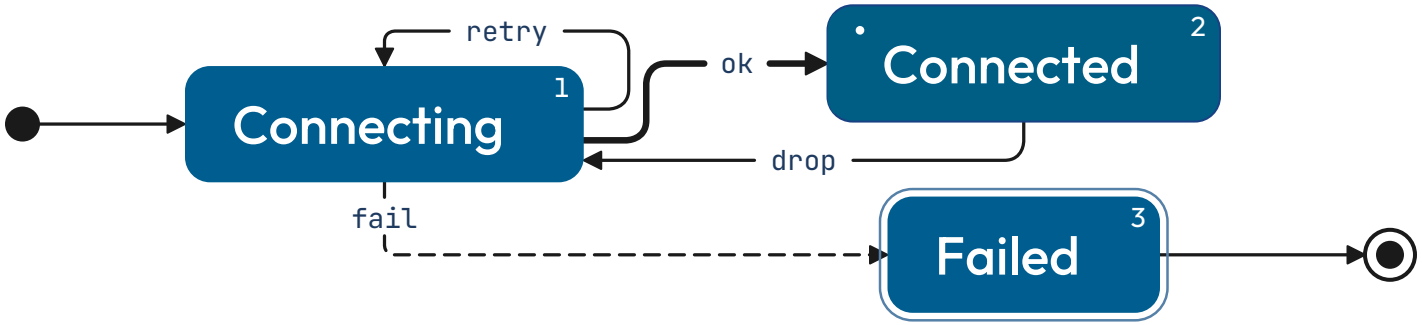

End states converge on one end marker, laid out with everything else.

Self-loops

A self-transition loops at a corner.

The router nests each loop outside its state's corner and keeps every other line clear of it.

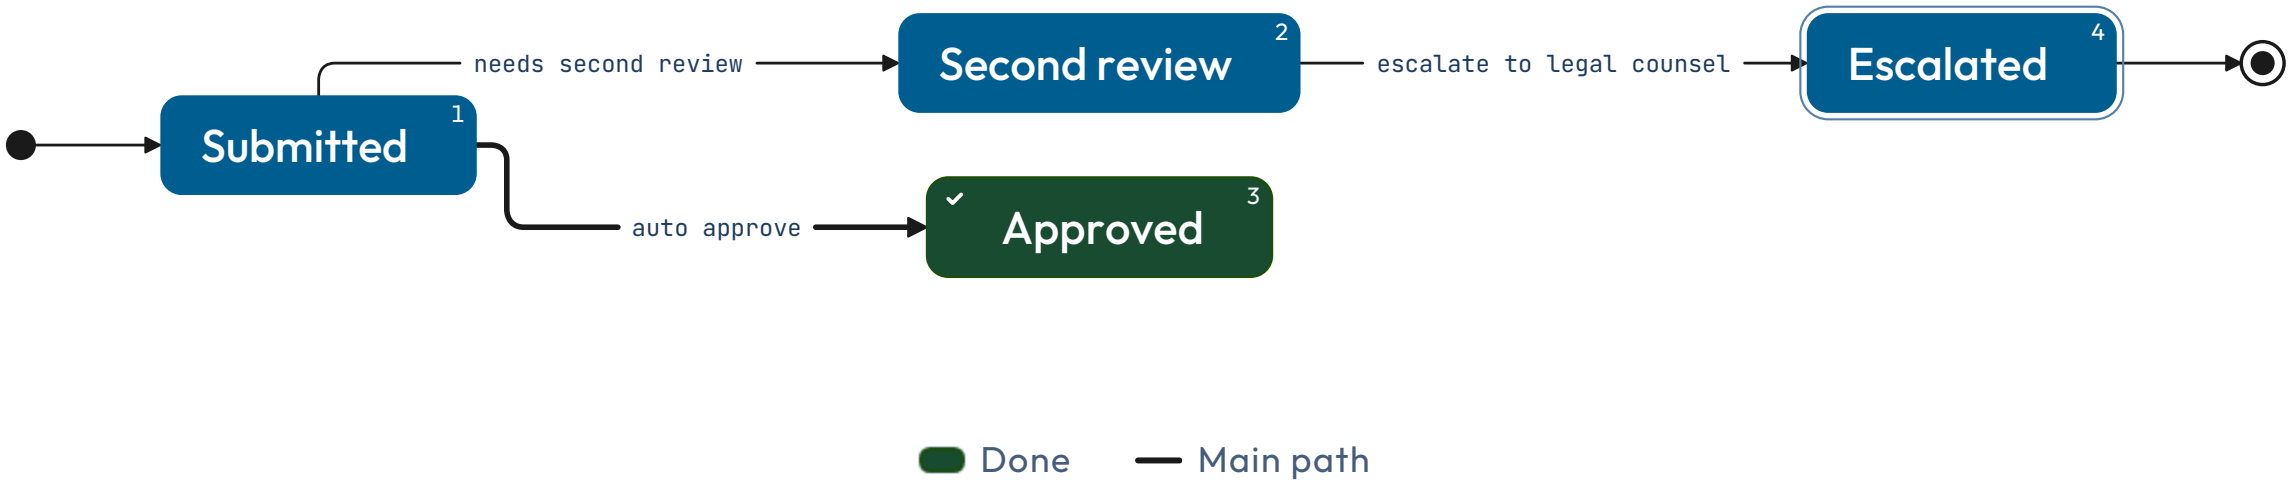

One router for every line, loops included.

Long labels

A long label sits on its line.

The router seats every label on its own line and cuts the line under it, so the label never crosses a state.

Keep an event to a few words: the gap it needs is the gap the machine gets.
