Studio · Present mode

The deck that presents itself.

Sections become a progress rail, your speaker notes sit beside the slide, and the narration reads itself aloud — the same source you authored, now a live talk.

Section 01

Framing

WHY PRESENT GREW

A viewer built for reading vs. a room built for speaking.

Both show the slide. Only one carries the talk track, the pacing, and a window for the room.

READ	PRESENT
• You scroll; the deck is a document	• You speak; the deck is a performance
• Notes stay hidden in the source	• Notes sit beside the slide, for you
• No sense of where you are in the arc	• The section rail shows the whole shape

Three numbers that made the case.

LOST IN THE AUTHOR'S HEAD — GAP

Section 02

The model

One source, four things it now does.

Play.

One control narrates the current slide and advances — like a video, no separate autoplay.

Caption.

The narration reads as a teleprompter crawl, so a muted room still follows every word.

Rail.

One segmented, section-grouped bar — where you are, click to jump, no dueling counters.

Stage.

A chrome-free window for the room: the deck, the captions, the rail.

> *The best presenter tool disappears in use — it carries your voice, not itself.*

— THE DESIGN BRIEF

Section 03

In the room

From open to close, one continuous flow.

1

Open

Enter Present; the slide takes the screen and the chrome goes quiet.

2

Speak

Play reads the note aloud, or you talk over a silent caption.

3

Move

Swipe, wheel, or arrow through; the rail tracks each step.

Present · ready when you are

Write the substance. Let the deck carry the talk.
