Lattice · Video plugin

A clip, drawn from your own record.

Four providers, three layouts, one line of Markdown each.

YouTube — the clip leads, a code lets the room follow.

Ninety seconds of a first-day admin going from signup to a published deck. Scan the code to open the video on your own screen.

Ree A., Head of Ops at Northwind

Vimeo — the same slide, without the code.

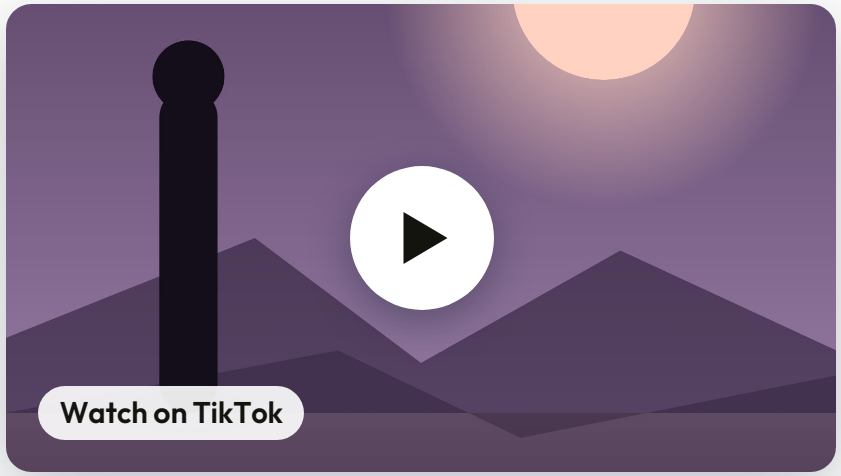

The poster is a plain link when you do not opt into `qr`. It still opens the clip, in print and on screen.

The launch film, director's cut

TikTok — a vertical clip keeps its own shape.

Short vertical video plays in a tall player. The poster is cropped to the slide's frame, and the badge names the provider.

NASA: Artemis II lifts off for the Moon.

Paste the address you already have.

It accepts the spelling you copy from a browser bar.

PROVIDER	ACCEPTED FORMS	BADGE
YouTube	`watch?v=`, `youtu.be/`, `shorts/`, `embed/`, `live/`	Watch on YouTube
Vimeo	`vimeo.com/123456`, `player.vimeo.com/video/123456`	Watch on Vimeo
TikTok	`@name/video/…`, short `vm.tiktok.com/…` links	Watch on TikTok
Instagram	`reel/`, `p/`, `tv/`	Watch on Instagram

No poster? A drawn stand-in holds the place.

Leave the poster off and the slide still reads as a video.

The address comes only from your record.

Nothing reads a slide's text, so a plugin's drawing never becomes a poster, a link or a scannable code.

Quote a tricky address

An equals sign or a comma needs quotes, so a start time such as `?t=90` stays inside it.

One record, one line

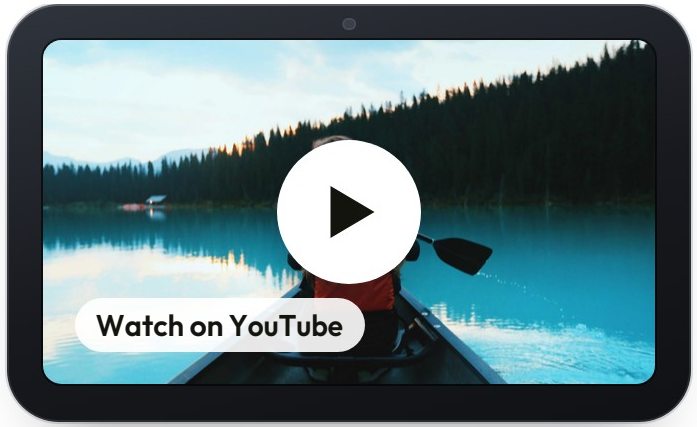

In running text it stays code, and the linter says why.

Foreign hosts get no badge

A provider's name in a path or fragment does not make it that provider.

New · the shared display layer

A clip on any slide, framed like the photos.

The 90-second tour

Next

Write the record. Lattice draws the rest.
