For revenue leaders · 2026

Northwind

Forecasting that learns from every deal — so your number stops being a guess.

Revenue forecasting just shifted from gut feel to a system of record.

For a decade, the forecast was a spreadsheet ritual — reps sandbagging, managers second-guessing, a number nobody trusted. AI-driven deal signals have ended that era. The forecast is now something you can measure, audit, and improve.

- The shift: from manager intuition to evidence drawn from the deals themselves.
- Teams still running the old ritual are forecasting blind against teams that aren't.

Every quarter you miss the number, the cost compounds beyond the miss.

A forecast that's wrong by 15% doesn't just dent the quarter. It misprices hiring, misallocates marketing, and erodes the board's confidence in every number you bring after it.

- Mid-market revenue teams miss forecast by a median of 14% each quarter.
- One blown quarter resets the credibility clock with the board to zero.

What forecast error actually costs

14%

median quarterly forecast error on mid-market revenue teams — enough to swing a hiring plan or a board's confidence.

Imagine opening the forecast and trusting it — because the deals back it up.

Northwind reads every email, call, and CRM change, scores each deal on the signals that actually predict closing, and rolls them into a forecast you can defend line by line. No sandbagging, no spreadsheet theater — just the number, with its evidence attached.

The promised land: a forecast that improves itself every quarter.

Each closed deal teaches the model what real buying signals look like in your business. The forecast that was a quarterly argument becomes a living instrument that gets sharper the more you sell.

- Every win and loss feeds the next quarter's accuracy.
- Managers coach on signal gaps, not on gut disagreements.

Only Northwind closes the loop from signal to forecast to coaching.

CRM forecast fields.

✅ In the workflow ❌ Reads real signals ❌ Learns from outcomes

Manual rollups; only as honest as the reps filling them in.

BI dashboards.

✅ In the workflow ⛔ Reads real signals ❌ Learns from outcomes

Shows you the past; predicts nothing forward.
