obligation-matrix

Regulation × obligation grid — state-marker cells encode applies / partial / exempt at a glance.

The matrix grids obligations across regimes.

✓ Applies − Partial / Exempt

Each lane stripe signals that the row is its own regime, not a rank.

Six regimes by five duties is the grid ceiling.

When NOT to reach for obligation-matrix.

Two regimes only

Past one row vs another the grid loses its purpose. Use `compare-prose` or `table` for two-regime comparisons.

Mixed cell content

Don't mix state markers with prose values in the same matrix — the cell width has to grow to fit prose and the marker grid collapses. Pick one cell type.

When NOT to reach for obligation-matrix.

Restating the key in prose

The grid now draws its own key — one named marker per state the cells actually carry — so a trailing sentence repeating 'filled = applies, half = partial' costs a line and can go stale against the markers on the slide. Rename the words with a label set instead; keep the paragraph for what the key cannot say.

Related components

See also.

`table` — cells are textual values, not state markers

`verdict-grid` — options scored against criteria with a per-card layout instead of a table

`matrix-2x2` — two axes, four cells, qualitative placement

`checklist` — one set of obligations against one regime, not many

`matrix-grid` — the grid marks one position on two ordered axes, not a pass/partial/exempt status per cell
