When NOT to reach for waterfall.

Independent magnitudes with no running total

Revenue by region, spend by department, five metrics side by side — nothing accumulates, so the floating geometry is a lie. Use `bar`.

Parts of one total, all positive

A decomposition where every contribution is a positive share of one whole is a stack, not a walk: use `stacked-bar`, or `piechart` if there is only one total. A waterfall's whole apparatus — the sign, the two semantic hues, the connectors — buys you nothing when nothing goes down.

A monotonic pipeline that narrows

Visitors to signups to paid is a subset at every stage, not a set of signed contributions. Use `funnel`, whose taper IS the conversion rate.

Drivers that are 1% of the anchors

A walk from 12.0M to 11.9M via steps of 20k gives you two full-height anchors and a row of hairlines. The chart is not wrong, but the picture says 'nothing happened' — which may be the finding, in which case say it in a `big-number`, or drop the anchors and plot the drivers alone as a

See also.

`bar` — the categories are independent magnitudes with no running total, or you want the drivers alone without the anchors

`stacked-bar` — the contributions are all positive parts of one total rather than signed changes to it

`funnel` — each stage is a subset of the one before and the drop-off rate is the story

`big-number` — the net movement is the whole point and the drivers are not worth a slide

`line` — the total moved over time and you want the shape of the path, not the attribution
