NEW COMPONENT · EVIDENCE · SPATIAL · SERIES

Show them where.

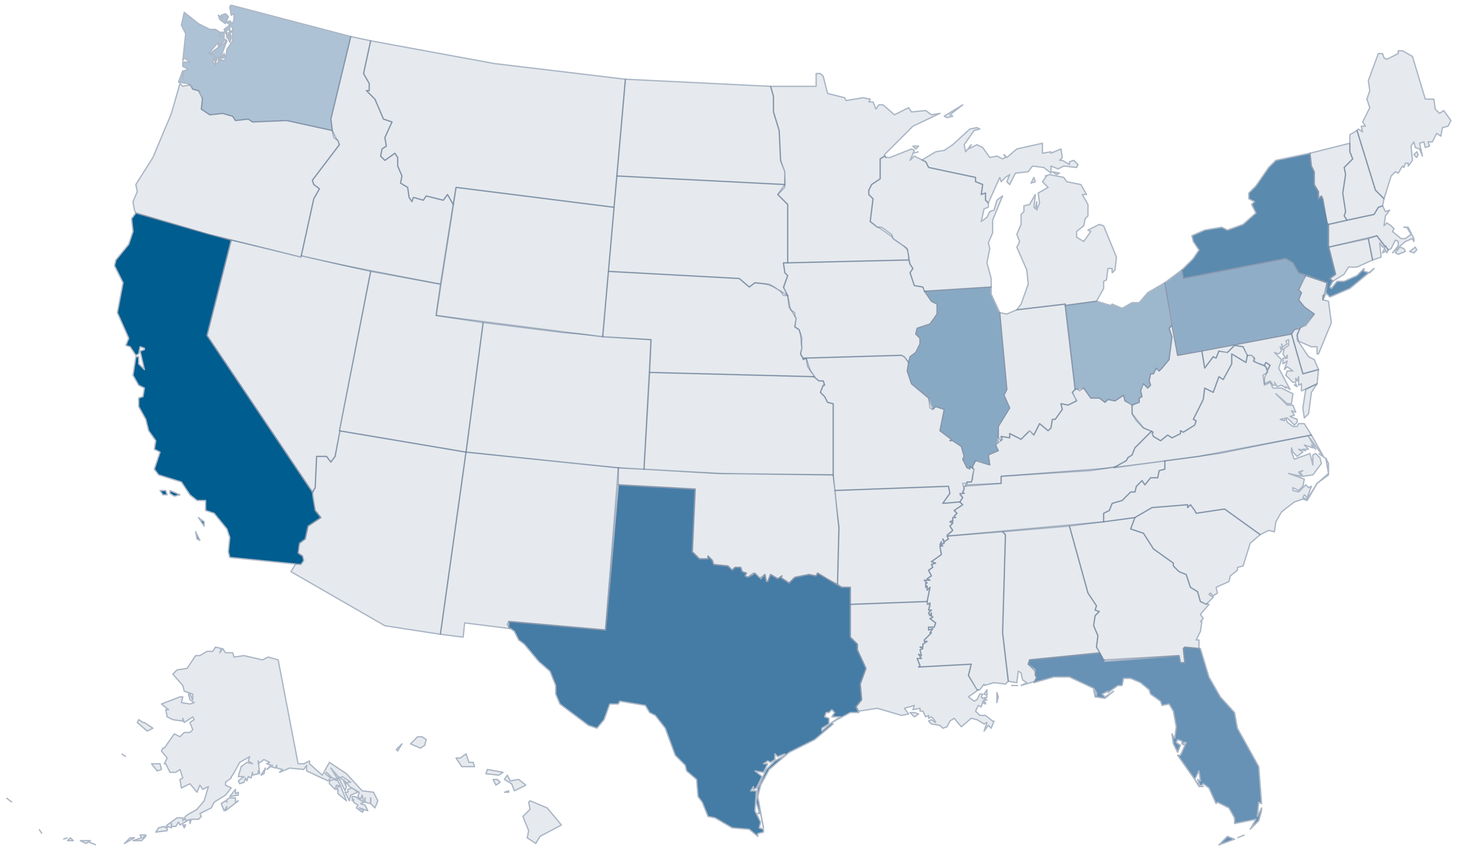

The first layout on the new **spatial** form — regions placed by real-world geography, not a grid or an axis. Author a value per named place; the basemap fills it. US states or world countries, for program reach, service territories, jurisdictions, and where the money landed.

One grammar, two basemaps, two reads.

Name a place, give it a value. The tokens pick the rest.

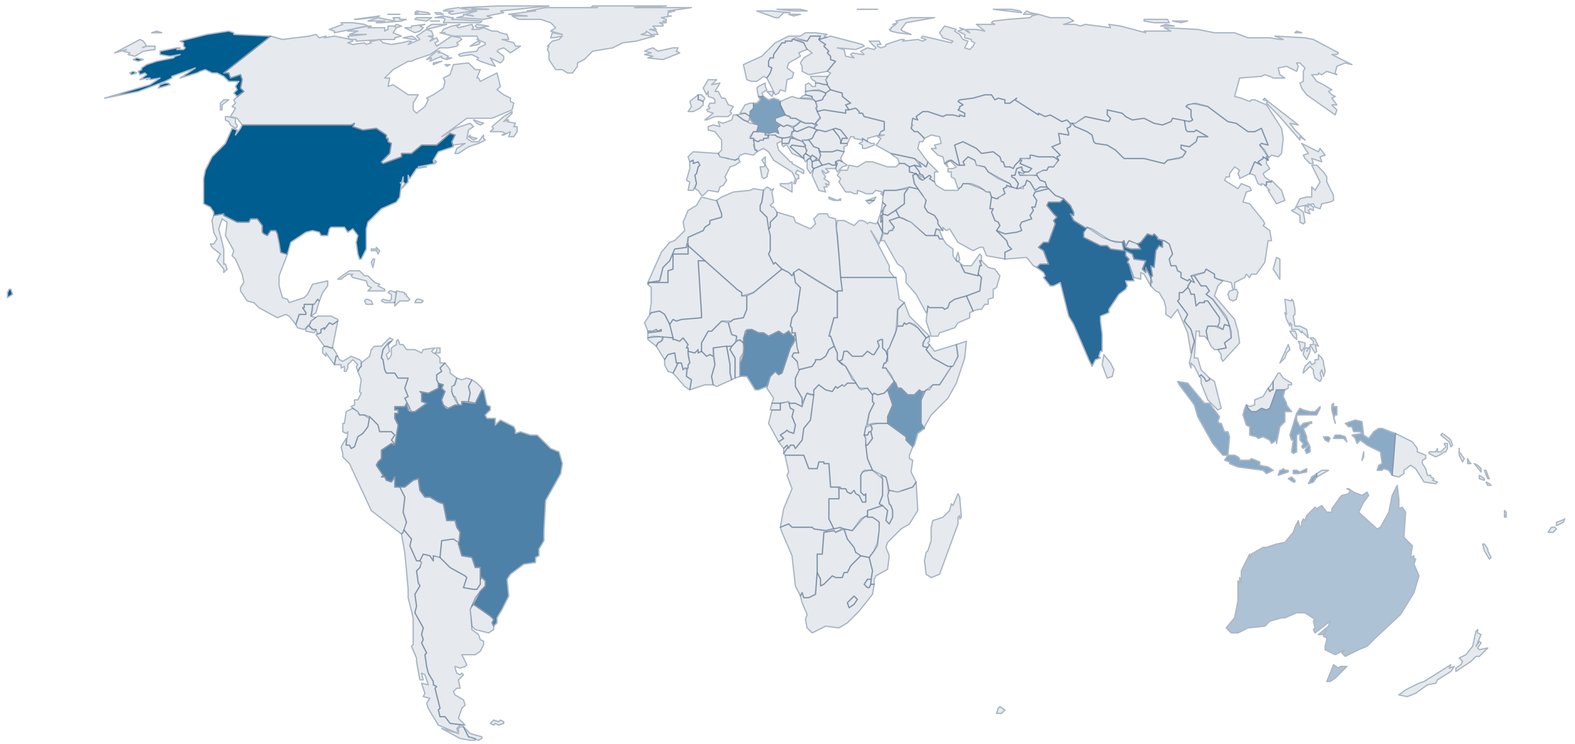

- `map` is US states; `map world` is world countries (Robinson projection). Same authoring — one place per li with a trailing inline-code value: `- Brazil \31``.
- **Choropleth** (default) shades one hue — *how much, where*. `highlight` colors each place — *which ones*.
- Names resolve loosely — `California` / `CA` / `Calif.`, or `Brazil` / `BR` / `Brasil` — and anything the basemap can't place is reported, never dropped.

Where the recovery grants landed.

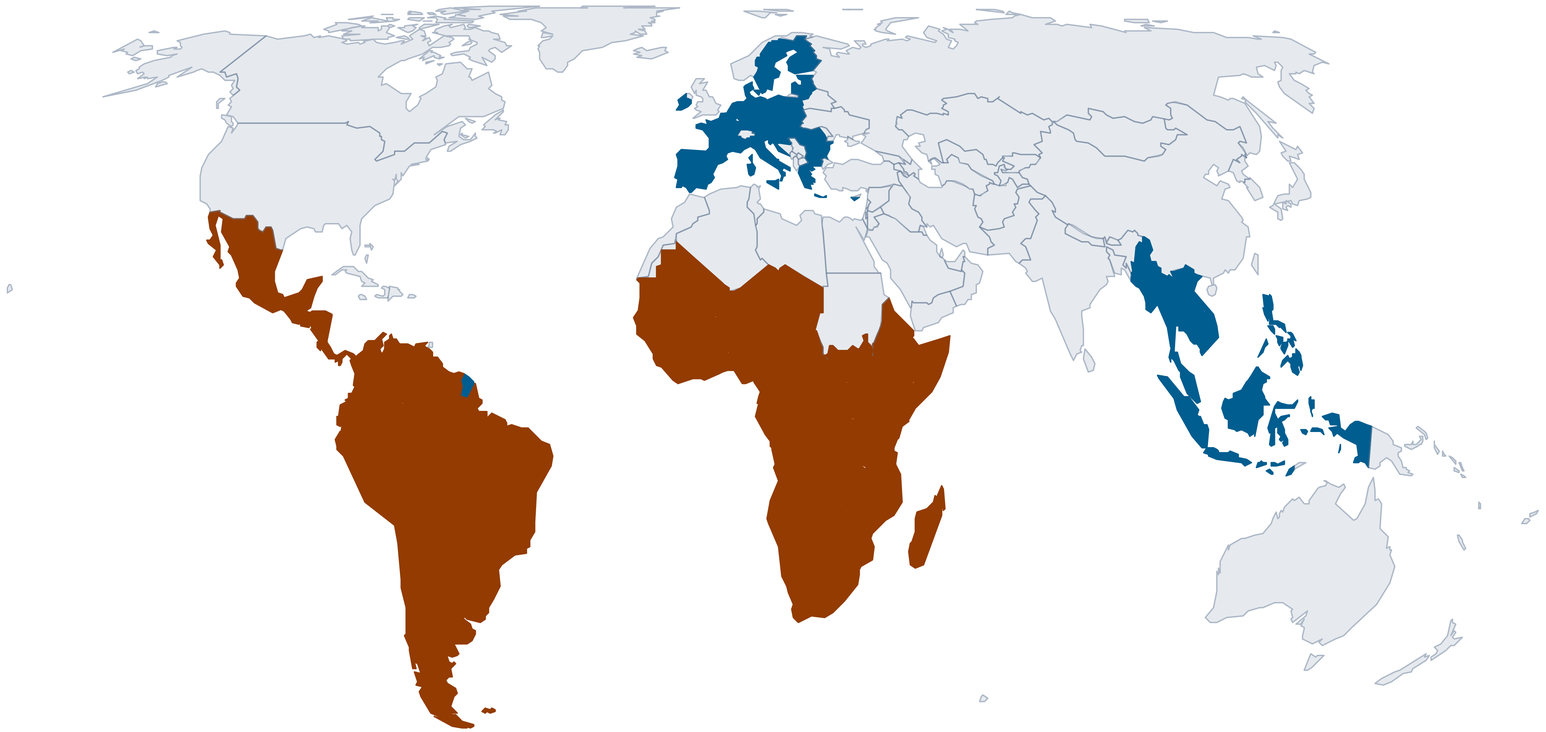

California	48.2
Texas	36.4
New York	31.0
Florida	27.5
Illinois	19.3
Pennsylvania	17.6
Ohio	14.1
Washington	9.6

Where our field offices operate.

United States	42
India	38
Brazil	31
Nigeria	27
Kenya	24
Germany	22
Indonesia	19
Australia	12

Coverage, told at bloc scale.

Groups

European Union	Tier 1
ASEAN	Tier 1
Sub-Saharan Africa	Tier 2
Latin America	Tier 2

Naming a region is the hard part — so we made it cheap.

World names vary wildly, and a mistyped one is a silent gap. Two defenses, both off the baked vocabulary.

- **Group as a fat alias.** Name a continent or a dated bloc — `European Union`, `Sub-Saharan Africa`, `G20` — and the kernel fills every member. Blocs carry the year their membership is asserted.
- **Autocomplete + did-you-mean.** Region names complete as you type; a name that slips through is flagged at lint time with the nearest match (`Brasil` resolves to `Brazil`).

What it doesn't do — yet.

- **No sub-national detail.** Counties, districts, and city pins are out of scope; the world cut (110m) also omits the smallest city-states.
- **Continents, blocs, and stated categories.** EU / ASEAN / G20 / BRICS / OECD ship with dated provenance; Global South / North too, pinned to a stated, dated definition (UN G77 + China) — so the definition travels with the data instead of every deck hand-rolling a roster.
- **No magnitude in highlight.** If you need *which* and *how much*, lead with choropleth and name the set in the prose.

MAP

Geography is the argument.

When where is the point — coverage, reach, jurisdiction — a basemap says it in one glance a table of names never will. When it isn't, reach for `progress` *or* `stats` *instead.*
