GANTT · STATE-CHART · PORTRAIT · 2026-06-

Native diagrams, made for the tall box.

A Gantt is a horizontal time axis and a state machine is a graph — neither is "Mermaid", and neither has a direction to flip. On a portrait deck they used to strand themselves in a short band. Now each restyles to the box it occupies.

Two charts, two different levers.

`gantt` is an HTML/CSS grid, so it reflows in CSS — no kernel change, landscape untouched. `state-chart` is native SVG whose edges are measured in the browser, so it fills the height and re-routes.

gantt →

Two charts, two different levers.

gantt — the lane label rides *above* full-width bars; lanes distribute down the canvas; the time axis stays aligned.

state-chart →

Two charts, two different levers. (cont.)

state-chart — the default fits a tall stage with a column; an `lr` machine falls back to `tb` where a row can't fit.

Landscape is byte-identical →

Two charts, two different levers. (cont.)

Landscape is byte-identical — every change is gated on a tall container.

Restyle, don't rearrange.

A Gantt and a journey can't "switch direction" — the constraint is structural. The win is treating a portrait deck as a different box to design for, not a landscape slide that got squeezed.
