

ACCENT AXIS · FRAMING ALIGNMENT

Headline alignment

The alignment of a slide's **framing text** — eyebrow, heading, rule, subtitle, below-note, key insight, caption — is no longer baked into each layout. One register, `headline:`, sets it deck-wide or per slide.

Every value defaults to `auto`, so today's decks are unchanged.

The component keeps its default

By default the register emits nothing and each layout keeps its own alignment — a content masthead sits **left**, a title stays **centered**.

`headline:` only moves when you ask.

KEY INSIGHT

Left by default — the eyebrow, heading, and this panel share one axis.

The same slide, centered

This slide carries `_class: head-center`. Every framing piece follows — no eyebrow left over a centered title, no note left behind.

KEY INSIGHT

Centered here — the panel stays full-width; only its text re-anchors.

And right, as one cluster

`head-right` anchors the framing to the right edge — the rare escape, included for symmetry with the body `align-*` controls, which stay independent.

KEY INSIGHT

The body `align-*` axis is untouched, so a right headline can sit over a left body.

H1 2026 • CENTERED HEADER

Charts follow, too

headline: center re-centers the chart's masthead and caption in lock-step — no left title over a centered caption.

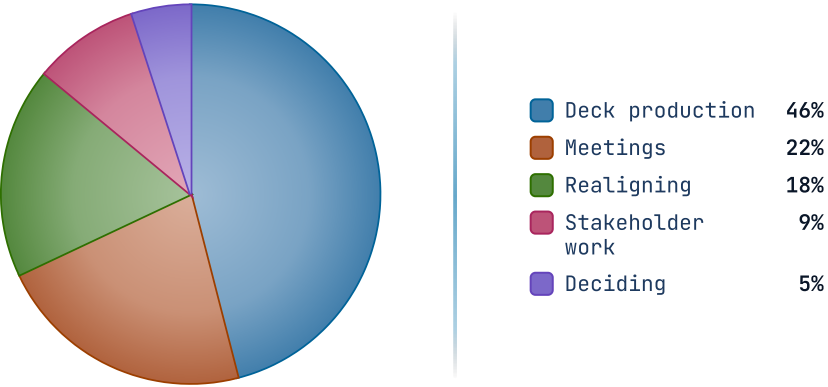

Figure 1 — the caption follows the same axis as the title above it.

Set it once for the whole deck

Add `headline: center` to the front matter and every slide centers its framing — the title and closing bookends included. A single slide opts back out with `←!— _class: head-left →`.

- Deck-wide
 - `headline: center` in the `---` block.
- One exception
 - `_class: head-left` on the slide that needs it.

SECTION • TWO

Dividers keep their own default

Alignment is now a token the author owns — `VAR(--HEADLINE-ALIGN)` — the way color already is. Set it deck-wide, override it per slide, and the framing text never disagrees with itself again.

WRAP

One axis, every framing
piece
