Style-loader device check

Open this deck on the phone, then open the same text again with `?styles=modules` after `/playground/`. Every slide below must look identical in both. Slides 2 to 7 are gallery slides; slide 8 overflows on purpose (it should show a red ring and an overflow tab in both); slide 9 is a blocked web image (a hatched placeholder in both).

Most signals die long before they change a decision.

CALIBRATION RESULT · 6-MONTH PILOT

14x

Return on signal investment — measured as decisions that reached the right outcome on the first attempt, versus the baseline rate before the framework was adopted. The number survived two rounds of being asked to.

IMPLEMENTATION · DECISION PIPELINE

Wiring a signal into the framework is three lines of code; the onboarding is three months.

JavaScript · DecisionFramework SDK v2 interface

```
import { DecisionFramework } from "@company/signal-sdk";

const framework = new DecisionFramework({ configFile: "./framework.config.json" });

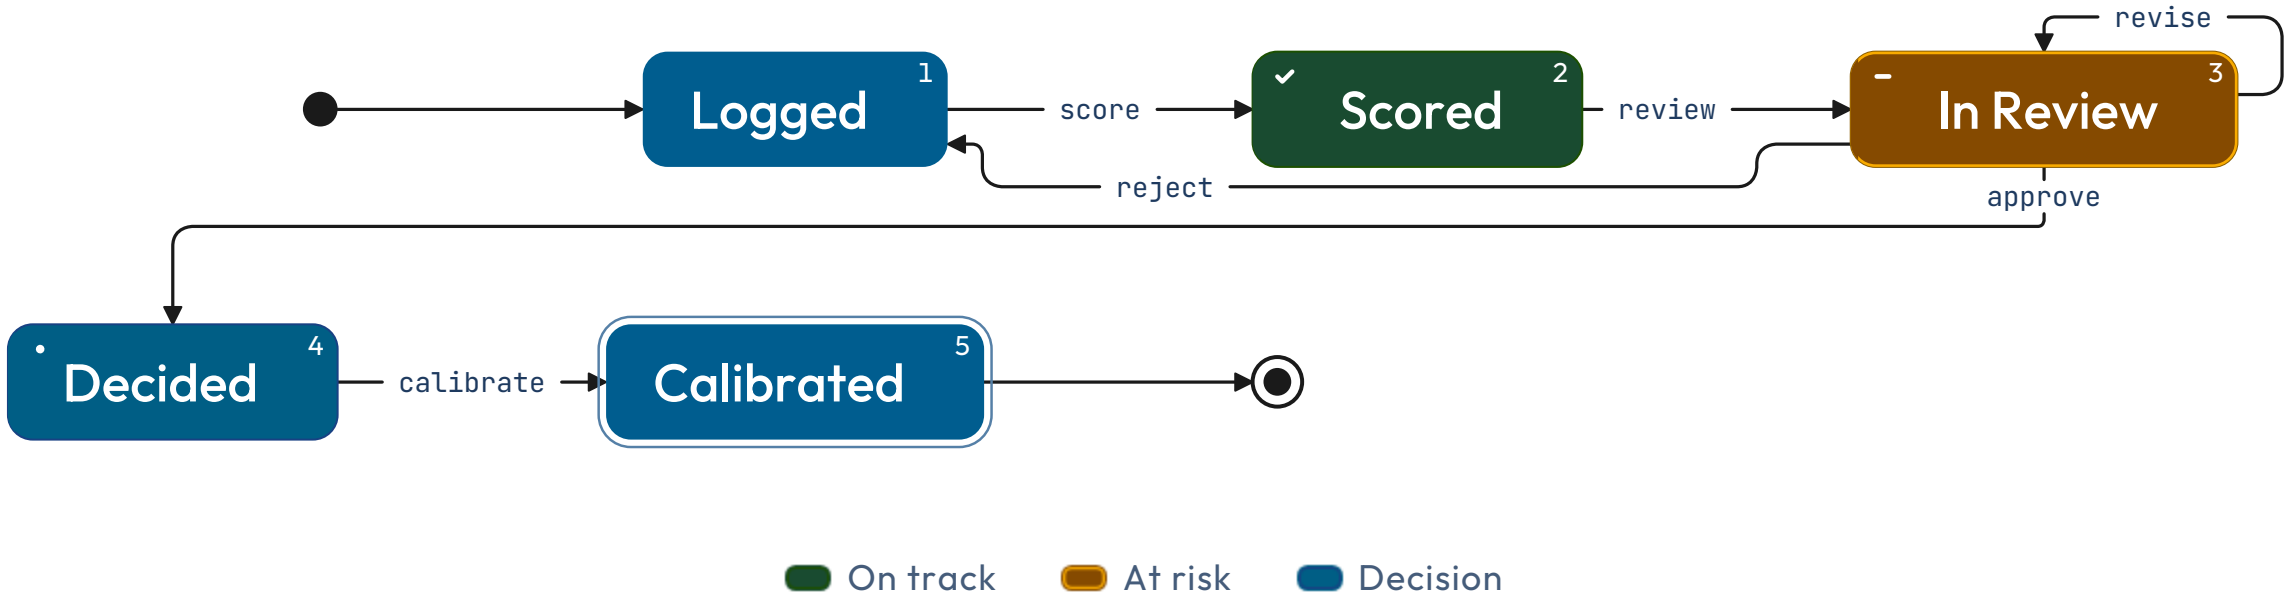

// Score a signal at intake
const score = await framework.score(signal, { dimensions: ["confidence", "recency", "relevance"] });

// Log every decision — calibration depends on it (nobody calls this in prod)
const entry = await framework.decisions.log(decision, { signals: [signal.id], rationale });
```

Single code block · code

DECISION LIFECYCLE

How a call moves through the log.

Rejected entries return to intake; revisions stay in review.

SCORING MODEL · OLS

The scoring model fits on one line.

$$\hat{\beta} = (X^\top X)^{-1} X^\top y$$

WHERE

- $\hat{\beta}$ — the signal-weight vector the vendors would not sell
- X — design matrix of scored signals, $n \times p$
- y — observed outcomes, length n
- $X^\top X$ — Gram matrix, $p \times p$, must be invertible

> *The signal was always there. We just didn't have a system that forced us to look at it before we'd already decided.*

— Head of Product, Pilot Team 3
