FIX · DECK-WIDE CLASS

One deck class, every slide

This deck says `class: no-progress` once, in its front matter.

SECTION 01

The deck turns the rail off

NO CLASS OF ITS OWN

A plain slide follows the deck

The front matter turned the section rail off, so this slide shows no dots in its footer band.

A deck class reaches every slide that names no class of its own.

ITS OWN _CLASS

A slide with its own class follows it too

Before

Marp let a slide's `_class` drop the deck class, bringing the rail back.

Now

The slide's classes add to the deck's, so the rail stays off here too.

WITH-PROGRESS

One slide can turn the rail back on

This slide adds `with-progress` to its own class. The section dots return in its footer band.

A slide overrides the deck with an explicit token, the way `with-pagination` brings back a page number.

SECTION 02

The same rule in an exported Marp bundle

EXPORT TO MARP

The bundle keeps its settings in one block

```
---
marp: true
theme: indaco
---
<script type="application/lattice-settings">
class: no-progress
</script>
```

✦ *Edit that block and marp-cli, the VS Code preview and VS Code's Export command all follow it.*

FIX · DECK-WIDE CLASS

One class, every slide

Override it on a slide with an explicit token.
