Fix · one header reader

A turned photo lands the way the browser paints it

Three pictures the old readers got wrong, and one they always got right

Exif after the frame header

The mug is stored on its side and turned back upright.

Its turn sits after the frame header, where every engine still reads it. The layout now sizes it as the wide photo it is, so the composition follows the picture you see.

Late Exif · in the PDF

The same file, drawn in the page, stays upright in the PDF.

The PDF writer embeds the file once and draws it through its turn, so it lands upright without a whole-slide photo.

PNG turned by eXIf

The canoe is a PNG that Chromium turns, and the layout now agrees.

The picture is stored a quarter turn round. Chromium and Firefox apply its rotation, so the layout reads it as wide.

Turned PNG · in the PDF

In the PDF it is no longer stretched across the turned box.

The writer used to embed the PNG's stored pixels into the box the browser had turned. It now stays in the slide's photo, as the browser painted it.

AVIF

An AVIF photo now gets its shape read like any JPEG.

The header reader finds the primary picture's size, so the layout picks a composition instead of falling back to its plainest one.

Control · an ordinary JPEG

A plain photo exports exactly as it did before.

Every gallery and photo deck kept its bytes; only the files above change.

Fix · one header reader

Each picture lands as painted.

One reader now settles every turn,
and the exports follow the browser.
