

ACCENT AXIS · FRAMING ALIGNMENT

Headline alignment

The alignment of a slide's **framing text** — eyebrow, heading, rule, subtitle, below-note, key insight, caption — is no longer baked into each layout. One register, `headline:`, sets it. `auto` keeps each component's own default; `left` pins the whole cluster to the margin.

The component keeps its default

By default the register emits nothing and each layout renders exactly as before — a content masthead sits **left**, a title stays **centered**. `headline:` only moves when you ask, so no existing deck shifts a pixel.

KEY INSIGHT

Left by default here — the eyebrow, heading, and this Key Insight already share one axis on a content slide.

A title centers by default. `_class: HEAD-LEFT` pins its eyebrow, heading, and subtitle to the left margin together — the whole framing cluster, not one piece.

SAME TITLE • HEAD-LEFT

Left-aligned, on demand

Even a centered layout follows

Set it once, or per slide

Add `headline: left` to the front matter and every slide left-aligns its framing — the title and closing bookends included. Or leave the deck on `auto` and pin just the slides that need it.

- Deck-wide
 - `headline: left` in the `---` block.
- Per slide
 - `_class: head-left` on one slide.

Center and right are coming

This ships the rock-solid core — `auto` and `left`. Centering and right-aligning the cluster on the full frame (especially against a masthead bay) is a deliberate follow-up, so it lands designed, not patched.

KEY INSIGHT

Alignment is a token the author owns now — `var(--headline-align)` — the way color already is.

`left` is the first value; the rest follow.

WRAP

One axis, every framing piece

Set `headline:` deck-wide or per slide, and the framing text stops disagreeing with itself. `auto` respects each component; `left` makes them all agree.
